"Capone and his influence are waning," Tracy said. "No matter what delusory victory he inflicts he cannot regain what he's lost, not now. I say we cannot permit him this gesture. The overall psychological dynamic of the situation has to be taken into account. The Confederation must survive, not only that it must be the entity which brings this crisis to a successful resolution. And the Navy is the embodiment of the Confederation, especially now. It must not be damaged. Not to the extent Pryor's mission is capable of."

"You're being as arrogant as Capone," Galic said. "Your thoughts, your opinions, are the ones which must prevail."

"We all know very well what has to prevail," she replied. "There has to be a valid species-wide government mechanism to implement the kind of policies which are going to be needed afterwards, and oversee the transition phase. For all

its faults, the Confederation can be made to work properly. If it fails the human race will fragment, socially, politically, economically, religiously, and ideologically. We'll be right back where we were in the pre-starflight age. It'll take centuries to recover, to get us back to where we are today. By that time we should have joined the transcendent-active population of this universe."

"We?"

"Yes. We. We privileged few. Just because we were engineered here doesn't mean we're not human. Two thousand years spent walking amongst our own people makes this the alien world."

"Now you're being melodramatic."

"Call it what you like. But I know what I am."

The internal sensors on the *Villeneuve's Revenge* revealed Kingsley Pryor to be alone in his own small cabin. He'd adopted the same unnerving posture which André and his three crew had witnessed throughout the tortuous flight. He hung centimetres from the decking, legs folded in Lotus position, with eyes granted a vision of some terribly personal hell. Even over the link from the starship, the CNIS duty officer could see he was suffering.

With the remote electronic survey complete, and hull plate 4-36-M now detached and held in the MSV's waldo, André was given a vector taking them in towards Trafalgar at a tenth of a gee. SD Command observed the flight computer responding to the crew's instructions, coaxing the fusion tube to life. They were following the security protocols to the last byte.

Kingsley drifted the last few centimetres down onto the decking, and suppressed a whimper at what that meant. During the flight he'd elevated his dilemma to a near physical pain, every thought he had concerning his destination burned from within. There simply was no way out of the

box Capone and his whore had trapped him in. Death surrounded him, making him more compliant than any set of sequestration nanonics could ever achieve. Death and love. He couldn't allow little Webster and Clarissa to vanish into the beyond. Not now. Nor could he let them be possessed. And the only way to prevent that from happening also could not be permitted.

Like men in his position throughout history, Kingsley Pryor did nothing as events swept him to their conclusion; simply waiting and praying that a magical third option would spring from nowhere. Now with the fusion drive pushing the starship towards Trafalgar, hope had cast him aside. The power he had been given to inflict suffering was insane in its size, yet he could *feel* Webster and Clarissa. The two balanced, as Capone knew they would. And now Kingsley Pryor had to make that impossible choice between the intimate and the abstract.

The cabin sensor had enough resolution to observe his lips contracting into a bitter smile. It looked as though a scream was about to burst loose. The CNIS duty officer shook her head at the way he was acting. Looks as though his brain's cracked, she thought. Though he was keeping passive enough.

What the sensor never showed her was a patch of air beside Kingsley's bunk thicken silently into the shape of Richard Keaton. He smiled sadly down at the stricken Navy officer.

"Who are you?" Kingsley asked hoarsely. "How did you hide on board?"

"I didn't," Richard Keaton said. "I'm not a possessed here to check up on you. I'm an observer, that's all. Please don't ask for who, or why. I won't tell you that. But I will tell you that Webster has escaped from Capone, he's no longer on Monterey."

"Webster?" Kingsley cried. "Where is he?"

"As safe as anyone can be right now. He's on a rogue ship that takes orders from no one."

"How do you know this?"

"I'm not the only person observing the Confederation."

"I don't understand. Why tell me this?"

"You know exactly why, Kingsley. Because you have a decision to make. You are in a unique position to affect the course of human events. It's not often an individual is put in this position, even though you don't appreciate all the implications stretching out ahead of you. Now, I can't make that decision for you, much as I'd like to. Even I can't break the restrictions I work under. But I can at least bend them enough to make sure you have all the facts before you pass your judgement. You must choose when and where you die, and who dies with you."

"I can't."

"I know. It's not easy. You just want the status quo to carry on for so long that you become irrelevant. I don't blame you for that, but it isn't going to happen. You must choose."

"Do you know what Capone did to me, what I'm carrying?"

"I know."

"So what would you do?"

"I know too much to tell you that."

"Then you haven't told me everything I need to know. Please!"

"Now you're just looking for absolution. I don't provide that, either. Consider this, I have told you what I believe you should know. Your son will not suffer directly from any action you take. Not now, nor in the time which follows."

"How do I know you're telling the truth? *Who are you?*"

"I am telling you the truth, because I know exactly what to tell you. If I wasn't what I say I am, how would I know about you and Webster?"

“What should I do? Tell me.”

“I just did.” Richard Keaton started to raise his hand in what could have been a gesture of sympathetic compassion. Kingsley Pryor never found out, his visitor faded away as beguilingly as he’d arrived.

He managed a small high-pitched snigger. People (or xenocs, or maybe even angels) were watching the human race; and were very good at it. It wouldn’t take much to see what was going on among the Confederation: a few carefully placed scanners could pick up the appropriate datavises, the CNIS and its counterparts did that as a matter of routine. But to secrete observers among the possessed cultures was an ability far beyond any ordinary intelligence agency. That kind of ability was unnerving. Despite that, he felt a small amount of relief. Whoever they were, they cared. Enough to intervene. Not by much, but just enough.

They knew the devastation he would cause. And they’d given him an excuse not to.

Kingsley looked straight at the cabin sensor. “I’m sorry. Really. I’ve been very weak to come this far. I’m ending it now.” He datavised an instruction into the flight computer.

On the bridge, André twitched in reaction as red neuroiconic symbols shrilled their warnings inside his skull. One by one, the starship’s primary functions were withdrawn from his control.

“Duchamp, what are you doing?” SD Command queried. “Return our access to the flight computer immediately or we will open fire.”

“I can’t,” the terrified captain datavised back. “The command authority codes have been nullified. Madeleine! Can you stop them?”

“Not a chance. Someone’s installing their own control routines through the Management Operations Program.”

“Don’t shoot,” André begged. “It’s not us.”

“It must be someone who had direct MOP access. That’s your crew, Duchamp.”

André gave Madeleine, Desmond, and Shane a frightened glance. “But we’re not . . . *merde*, Pryor! It’s Pryor. He’s doing this. He was the one who wanted to come here.”

“We’re powering down,” Desmond shouted. “Fusion drive off. Tokamak plasma cooling. Damn, he’s opened the emergency vent valves. All of them. What’s he doing?”

“Get down there and stop him. Use the hand weapons if you have to,” André shouted. “We’re cooperating,” he datavised at SD Command. “We’ll regain control. Just give us a few minutes.”

“Captain!” Shane pointed. The hatch in the decking was sliding shut. Orange strobes started to flash with near-blinding pulses in time to a piercing whistle.

“*Mon dieu, non!*”

SD sensors relayed a perfectly clear image of the *Vileneuve’s Revenge* to the CNIS duty officer. The ship was well into its deceleration phase when the emergency started. It was less than two hundred kilometres away from Trafalgar’s counter-rotating spaceport, which was grave cause for concern. The crew’s apparent dismay could just be one massive diversion. If a salvo of combat wasps were fired at the asteroid from this distance it would be almost impossible to intercept all of them.

Had it just been Duchamp and his crew on board, she would have vaporised the starship there and then. But Pryor’s actions and enigmatic statement just before his cabin sensor had gone off line stayed her hand. She was sure he was doing this; and the one routine which the starship had left open to Trafalgar’s scrutiny was fire control to the combat wasps. Pryor must be trying to reassure SD Command. None of the lethal drones had been armed.

“Keep tracking it with a full weapons lock,” she datavised

to her fellow officers in the SD Command centre. "Tell the voidhawk escort to stand by."

Long jets of snowy vapour were squirting out from the *Villeneuve's Revenge* as the emergency vent emptied every tank on board. Hydrogen, helium, oxygen, coolant fluid, water, reaction mass; they all emerged under high pressure to shake the ship about as if a dozen thrusters were firing in conflicting directions. None of them were powerful enough to affect its orbital trajectory. With its deceleration burn interrupted, it continued to fly towards Trafalgar at nearly two kilometres per second.

"They're not going to have any fuel even if they do regain control of the propulsion systems," the SD guidance officer said. "The ship will impact in another two minutes."

"If it gets within ten kilometres of Trafalgar, destroy it," the CNIS duty officer ordered.

The multiple vent continued unabated for another fifteen seconds, giving the ship a highly erratic tumble. Explosive bolts detonated across the fuselage, punching out dry plumes of grey dust as they severed the outer stress structure. Huge segments of the hull peeled free like dusky silver petals opening wide, exposing the tight-packed metallic viscera. Sharp bursts of blue light flashed beneath the surface, visible only through the slimmest of fissures; more explosive bolts, detaching equipment from the internal stress grid. The starship began to break apart, its tanks, drive tubes, tokamak toroids, energy patterning nodes, heat exchangers, and a swarm of subsidiary mechanisms forming a slowly expanding clump.

Three high-thrust solid rocket motors were clustered around the base of the life support capsule which contained the bridge; they ignited with only the briefest warning, thrusting the sphere clear of the cloud of technological detritus. Duchamp and the others were flung back into their ac-

celeration couches, bodies straining against the fifteen-gee acceleration.

“My ship!” André screamed against the punishing force. The *Villeneuve's Revenge*, the one last minuscule glint of hope for a post-crisis existence he had left, was unravelling around him, its million-fuseodollar components spinning off into the depths of the galaxy, transforming themselves into unsalvageable junk. Loving the ship more deeply than he did any woman, Duchamp forgave the eternal demands which it made for his money, its temperamental functions, its thirst for fuel and consumables; for in return it gave him a life above the ordinary. But it wasn't quite fully paid for, and years ago he'd forsaken a comprehensive insurance policy with those legalized thieving *anglo* insurance companies in favour of trusting his own skill and financial acumen. His scream ended in a wretched juddering sob. This universe had just become worse than anything which the beyond promised.

Kingsley Pryor didn't ignite the rockets on his own life support capsule. There was nowhere for him to escape to. The debris of the *Villeneuve's Revenge* was churning heatedly now, agitated by the bridge's life support capsule erupting from its centre. But it was still all sweeping towards Trafalgar, and carrying Kingsley along with it. He didn't know exactly where he was; he couldn't be bothered to access the rudimentary sensors surmounting the capsule. All he knew was that he'd done his best by the crew, and he wasn't in Trafalgar where Capone wanted him to be. Nothing else mattered any more. The decision had been taken.

Floating alone in a cabin illuminated only by tiny yellow emergency lights, Kingsley datavised the off code to an implant in his abdomen. The little containment field generator represented the peak of Confederation technology; even so it pushed way beyond the kind of safety specifications normally used for handling antimatter. The ultra-specialist mil-

itary lab in New California which manufactured it had neglected to include the standard failsafe capacity which even the most cheapskate black syndicates employed. Capone had simply decreed that he wanted a container defined by size alone. That's what he got.

When the confinement field shut down, the globe of frozen anti-hydrogen touched the side of the container. Protons, electrons, anti-protons, and anti-electrons annihilated each other in a reaction that very, very briefly recreated the energy density conditions which used to exist inside the Big Bang. This time, it didn't result in creation.

SD platform lasers were already picking off the gyrating chunks of equipment around the fringe of the debris cloud that had once been the *Villeneuve's Revenge*. The bulk of the swarm was less than twenty-five kilometres from Trafalgar, on a course that would collide with one of the spherical counter-rotating spaceports. Ionized vapour from the disintegrating components fluoresced a pale blue from the energy beams stabbing through them, forming a seething bow-wave around the remaining pieces. It was as if a particularly insubstantial comet was shooting across space.

Kingsley Pryor's life support capsule was twenty-three kilometres and eight seconds away from the spaceport when it happened. Another three seconds and the SD lasers would have targeted it, not that it would have made much difference. Capone had intended to do to Trafalgar what Quinn Dexter had done to Jesus; with the antimatter detonating in one of the biosphere caverns the asteroid would have been blown apart. Even if Kingsley didn't cheat his way past the inevitable security checks and had to kamikaze in the spaceport, the damage would have been considerable, destroying the counter-rotating sphere, any ships docked, and possibly dislodging the asteroid from its orbit.

By switching off the confinement chamber outside Trafalgar, Kingsley would be reducing the damage considerably.

Enough to salvage his conscience and allow him to return to New California claiming a successful mission. However, in physical terms, he wasn't doing the Confederation Navy much of a favour. Unlike a fusion bomb, the antimatter explosion produced no relativistic plasma sphere, no particle blast wave; but the energy point which sprang into life had the strength to illuminate the planet's nightside a hundred thousand kilometres below. The visible and infrared spectrum it emitted contained only a small percentage of the overall energy output. Its real power was concentrated in the gamma and X-ray spectrums.

The surrounding shoal of metal trash which had been the *Villeneuve's Revenge* twinkled for a picosecond before evaporating into its sub-atomic constituents. Trafalgar proved somewhat more resilient. Its mottled grey and black rock gleamed brighter than the sun as the energy tsunami hammered against it. As the white light faded, the surface facing the blast continued to glow a deep crimson. Centrifugal force stirred the sluggish molten rock, sending it flowing out along the humps and crater ridges where it swelled into bulbous fast-growing stalactites. Town-sized heat exchangers and their ancillary equipment anchored to the rock crumpled, their composite components shattering like antique glass while the metal structures turned to liquid and dribbled away, scattering scarlet droplets across the stars.

Hundreds of starships were caught by the micro-nova burst. Adamist vessels were luckier, in that their bulky structure shielded the crews from the worst of the radiation. Their mechanical systems underwent catastrophic failure as the X-rays penetrated them, instantly turning them into flying wrecks, coughing out vapour like the *Villeneuve's Revenge*. Scores of life support capsules hurtled clear of the dangerously radioactive hulks.

Exposed voidhawks suffered badly. The ships themselves died wretchedly as their cells' integrity was decimated. The

further they were from the detonation, the longer their misery was dragged out. Their crews in the thin-walled, exposed toroids were killed almost instantly.

Trafalgar's spherical counter-rotating spaceport buckled like a beachside shack in a hurricane. The nulltherm foam coating its girders and tanks crisped to black and moulted away. Air in the pressurized sections was superheated by the radiation, expanding with explosive force, ripping every habitable section to shreds. Tanks ruptured. Fusion generators destabilised and flash vaporised.

The concussion was totally outside the load capacity of the spindle. With fusion generator plasma roaring out of the collapsing sphere, the slender gridwork started to bend. It snapped off just above the bearing and took flight, deflating into a flaccid carcass beneath the short-lived fireballs puffing open across its superficies.

A dozen datavised emergency situation alerts vibrated urgently inside Samual Aleksandrovich's skull. He looked up at the staff officers conducting the daily strategy review. More worrying than the initial crop of alerts was three of them immediately failing as their processors crashed. Then the lights flickered.

Samual stared at the ceiling. "Bloody hell." Information pouring into his mind confirmed there'd been an explosion outside the asteroid. But big enough to affect internal systems? Outside his panoramic window, the central biosphere's axial light gantry was darkening as the civil generators powered down in response to losing their cooling conduits. Whole sections of the asteroid's ultra-hardened communications net had gone off-line. Not a single external sensor remained active.

The office lighting and environmental systems switched to their back-up power cells. High-pitched whines, the daily background sound pervading the entire asteroid, began to deepen as pumps and fans shut down.

Seven marines in full body armour rushed into the office, a detachment of the First Admiral's bodyguard. The captain in charge didn't even bother to salute. "Sir, we are now in a C10 situation, please egress your secure command facility."

A circular section of floor beside the desk was sinking down to reveal a chute that curved away out of sight. Flashing lights and sirens had begun to echo the datavised alarms. Thick metal shields were closing across the window. More marines were running along the corridor just outside the office, shouting instructions. Samual almost laughed at how close such dramatics came to being counter-productive. People needed to remain calm in such events, not have their fears accentuated. He considered refusing the earnest young captain's directive; gut instinct, acting out the role of gruff lead-from-the-front commander. Trouble was, that kind of gesture was so totally impractical at his level. Preserving the authority of the command structure was essential in a crisis of this magnitude. Threats had to be countered swiftly, which only an uninterrupted chain of command could achieve.

Even as he hesitated, the floor trembled. They really were under attack! The concept was incredible. He stared at the cups on the table in astonishment as they started to jitter about, spilling tea.

"Of course," he told the equally apprehensive marine captain.

Two of the marines jumped down the chute first, their magpulse rifles drawn ready. Samual followed them. As he skidded his way down along the broad spiral an assessment and correlation program went primary in his neural nanonics, sorting through the incoming datastreams to discover exactly what had happened. SD Command confirmed the *Villeneuve's Revenge* had detonated a quantity of antimatter. The damage to Trafalgar was considerable. But it was the thought of what had happened to the ships of the 1st Fleet

which chilled him. Twenty had been docked at the time of the explosion, three further squadrons had been holding station a hundred kilometres away. Two dozen voidhawks were on their docking ledge pedestals. Over fifty civil utility and government craft were in close proximity.

The secure command facility was a series of chambers dug deep into Trafalgar's rock. Self sufficient and self-powered, they were designed to hold the First Admiral's staff officers during an attack. Any weapon powerful enough to damage them would split the asteroid into fragments.

In view of what had just happened, it wasn't the most comforting thought Samuel had with him as he came off the end of the chute. He strode into the coordination centre, drawing nervous glances from the skeleton crew on duty. The long rectangular room with its complex curving consoles and inset holographic windows always put him in mind of a warship's bridge; with the one advantage that he'd never have to endure high-gee manoeuvres in here.

"Status please," he asked the lieutenant commander in charge.

"Only one explosion so far, sir," she reported. "SD command is trying to re-establish contact with its sensor satellites. But there were no other unauthorised ships within the planetary defence perimeter when we lost contact."

"Don't we have *any* linkages?"

"There are some sensors functional on the remaining spaceport, sir. But they're not showing us much. The anti-matter's EM pulse crashed a lot of our electronics, even the hardened processors are susceptible to that power level. None of the working antennas can acquire an SD platform signal. It could be processor failure, or actual physical destruction. We don't know which yet."

"Get me a GDOS satellite, then. Link us to a starship. I want to talk to somebody who can see what's going on outside."

“Yes sir. Combat back-up systems are deploying now.”

More of the coordination centre crew were hurrying in and taking their places. His own staff officers were coming in to stand behind him. He caught sight of Lalwani and beckoned urgently.

“Can you talk to any voidhawks?” he asked in a low voice when she reached him.

“Several.” Deep pain was woven across her face. “I feel them dying still. We’ve lost over fifty already.”

“Jesus Christ,” he hissed. “I’m sorry. What the hell’s happening out there?”

“Nothing else. There are no Organization ships emerging as far as the survivors are aware.”

“Sir!” the lieutenant commander called. “We’re re-establishing communications with the SD network. Three GDOS satellites are out, they must have been irradiated by the explosion. Five are still functional.”

One of the holographic windows flickered with orange and green streaks, then stabilized. The image was coming from an SD sensor satellite; it was positioned on the perimeter of Trafalgar’s defence network, ten thousand kilometres away. None of the inner cordon of satellites had survived.

“Hell,” the First Admiral muttered. The rest of the coordination centre was silent.

Half of Trafalgar’s lengthy peanut-shape glimmered a deep claret against the starscape. They could see sluggish waves of rock crawling across the ridges, boulder-sized globules sprinkling from the crests, cast away by the asteroid’s rotation. The ruined spaceport was retreating from its fractured spindle, turning slowly and scattering blistered fragments in its wake. Igneous spheres drifted without purpose around the stricken rock, squirting out sooty vapour like cold comets: the ships too close to the antimatter blast for their crews to survive the radiation blaze.

“All right, we’re intact and functional,” the First Admiral

said sombrely. "Our first priority has to be re-establishing the SD network. If they have any sense of tactics, the Organization will try to hit us while our weapons platforms are disabled. Commander, bring in two squadrons of 1st Fleet ships to substitute for the SD platforms, and reassign the planetary network to provide us with as much cover as it can. Tell them to watch for an infiltration mission, as well; I wouldn't put that past Capone at this point. Once that's done, we can start initiating rescue flights for the survivors."

The coordination centre crew spent an hour orchestrating the surviving 1st Fleet squadrons into a shield around Trafalgar. With more and more back-up communication links coming on line, information began pouring in. Three quarters of the asteroid's SD network had been wiped out in the blast. Over a hundred and fifty ships had been completely destroyed, with a further eighty so radioactive they were beyond rescue. Of the spaceport facing the *Villeneuve's Revenge* nothing had survived; once the bodies had been retrieved it would have to be nudged into a sun-intercept orbit. Initial casualty figures were estimated at eight thousand, though the coordination centre crew felt that was optimistic.

Once his orders were being implemented, the First Admiral reviewed the SD command centre files on the *Villeneuve's Revenge*. He convened a preliminary enquiry team of six from his staff officers, briefing them to assemble a probable chain of events. The last moments of the angst-laden Kingsley Pryor replayed a dozen times through his neural nanonics. "We'll need a full psychological profile," he told Lieutenant Keaton. "I want to know what they did to him. I don't like the idea that they can turn my officers against the Navy."

"The possessed are only limited by their imagination, Admiral," the medical liaison officer said politely. "They could apply a great deal of pressure to individuals. And

Lieutenant-commander Pryor had his family stationed with him on New California, a wife and son.”

“I pledge to place myself and my actions above all personal considerations,” Samuel quoted quietly. “Do you have family, Lieutenant?”

“No sir, no direct family. Though there is a second cousin I’m quite fond of; she’s about the same age as Webster Pryor.”

“I suppose academy oaths and good intentions don’t always survive the kind of horror real life throws at us. But it looks like Pryor was having second thoughts at the end. We should be grateful for that. God alone knows what kind of carnage he would have unleashed if he’d got inside Trafalgar.”

“Yes, sir. I’m sure he did his best.”

“All right, Lieutenant, carry on.” Samuel Aleksandrovich returned to the situation display swarming through his mind. With the Strategic Defence redeployment under way and ships assigned to rescue duties, he could concentrate on Trafalgar itself. The asteroid was in bad shape. Essentially all of its surface equipment had been vaporized; and that was ninety per cent heat dump mechanisms. The asteroid was generating almost no power, its environmental systems were operating on their reserve supplies alone. None of the biosphere caverns or habitation sections could get rid of their heat into space, the emergency thermal stores had ten days’ capacity at most. When the habitat was designed no one had envisaged this kind of absolute damage; it had been assumed that the heat dump panels wrecked by a combat wasp could be replaced in the ten-day time scale. Now though, even if Avon’s industrial stations could manufacture enough hardware fast enough, it couldn’t be attached. Half of the rock surface was so radioactive it would have to be cut off to a depth of several metres. And that same half was also extremely hot. Most of that heat would radiate outwards

over the next couple of months, but a considerable fraction would also seep inwards. Left unchecked, the temperature in the biosphere caverns would rise high enough to sterilise them. The only way to prevent that from happening was with heat dump mechanisms, which couldn't be replaced because of the heat and radiation.

Samual cursed as the civil engineering teams datavised their various assessments and recommendations. Cost aside, he couldn't possibly begin a program like that in the middle of this crisis.

He was going to have to evacuate the asteroid. There were contingency plans for dispersing the Navy institutions and forces around Avon's moons and asteroid settlements. That wasn't the problem. Capone had won a profound propaganda victory. The headquarters of the Confederation Navy bombed into extinction, whole squadrons lost, voidhawks dead. It would completely negate the entire Mortonridge Liberation campaign in the opinion of the general public.

Samual Aleksandrovich sank back into his chair. The only reason he didn't bury his head in his hands was because of all the eyes watching him, needing him to remain confident.

"Sir?"

He looked up to see Captain Amr al-Sahhaf's normally calm face contaminated with apprehension. Now what? "Yes, Captain."

"Sir, Dr Gilmore reported that Jacqueline Couteur has escaped."

A cold fury that Samual hadn't experienced for a long time pushed its way through his rational thoughts. The damned woman was becoming his *bête noir*, a ghoulish feeding off the Navy's misfortune. Lethal, and contemptuously smug . . . "Has she broken out of the laboratory?"

"No sir. The demon trap's integrity has been maintained throughout the assault."

"Very well, assign a squad of marines, and whatever else

Dr Gilmore says he needs to find her. Full priority.” He ran a search program through several files. “I want lieutenant Hewlett placed in charge of the search mission. My orders to him are very simple. Once she has been recaptured, she is to be put directly into zero-tau. And I do mean: directly. In future, Dr Gilmore can use someone less troublesome for his research.”

By the third doorway, it was noticeably warmer than usual in the broad corridor leading towards the CNIS secure weapons laboratory. The heat given off by the armour of thirty-five marines was accumulating in the air. Conditioning vents running along the ceiling were operating on reduced cycle mode; only a third of the light panels were on.

Murphy Hewlett took point duty himself, leading his squad along. They were each armed with static-bullet machine pistols modelled on Ombey’s design, with five of the team carrying Bradfields just in case. Murphy had taken time to brief them personally while they suited up; laying down simple procedures for engaging the possessed, hoping he was coming on confident.

As they arrived at the third door he signalled their technical sergeant forward. The man walked over to the door’s control processor, and studied his own block.

“I can’t find any time log discrepancies, sir,” he reported. “It hasn’t been opened.”

“Okay. Front line ready,” Murphy ordered.

Eight marines spread out across the corridor, lining their machine guns up on the door. Murphy datavised Dr Gilmore that they were in position and ready. The door swung up, hissing from the pressure difference. Tendrils of pale white vapour licked around the edges as hot and cold air intermingled. Dr Gilmore, five other researchers, and three armed marines were standing just inside. No one else was visible.

Murphy switched on his suit's audio circuit. "In!" he ordered.

The marine squad surged forward, forcing the scientists to bunch together as they bustled past. Murphy datavised a close order at the door's processor, and entered his own codelock. The big slab of metal swung down again, sealing into place.

"Jacqueline isn't in this section," Dr Gilmore said, bemused by their military professionalism.

In answer, Murphy beckoned him forwards and touched a static sensor against his arm. The result was negative. He told his squad to check the others. "If you say so, Doctor. What exactly happened?"

"We think the EMP interrupted the electricity supply we were using to neutralize her energistic power. It shouldn't have done; we're exceptionally well shielded in here, and our systems are all independent apart from the heat exchange mechanisms. But somehow she was able to overcome the marine guards and break out of the isolation laboratory."

"Overcame, how, exactly?"

Pierce Gilmore gave a humourless smile. "She killed them, and two of my staff. This escapade is a futile gesture of defiance. Not even Jacqueline can walk through two kilometres of solid rock. She knows this, of course. But causing us the maximum amount of disruption is part of her tiresome little game."

"The whistle has just been blown, Doctor. My orders are that upon capture she is to be placed in zero-tau. They came right from the First Admiral, so please don't query them."

"We are on the same side, Lieutenant Hewlett."

"Sure thing, Doc. I was in the courtroom. Remember that."

"I am on record as objecting to that adventure. Couteur is

extremely duplicitous, and intelligent. It is a bad combination.”

“We’ll bear that in mind. Now how many of the lab staff have you accounted for?”

Gilmore glanced along the main corridor running round the laboratory complex. Several of the silvery doors were open, with people peering out nervously. “Nine have not responded to my general datavise.”

“Shit!” Murphy accessed the floor plan file in his neural nanonics. The laboratory complex covered two levels; essentially a ring of research labs on top of the environmental and power systems, with storage and engineering facilities included. “Okay, everyone is to return to their office or lab, wherever they are now. The existing marine detail is to stay with them and guard against intrusion. I don’t want anyone moving round except for my squad, and that includes you, Doctor. Then I want an AI brought on-line to monitor the complex’s processors for glitches.”

“We’re doing that already,” Gilmore said.

“And it can’t find her?”

“Not yet. Jacqueline knows how we track possessed, of course. She will be concealing her power. Which means she will be vulnerable during the first few seconds after you locate her.”

“Yeah. Tell you, it’s all good news, this assignment, Doc.”

The procedure Murphy initiated was a simple enough one; five marines were left behind to cover the door in case Couteur made a break for it. Unlikely, Murphy admitted to himself, but with her there was always the prospect of double bluff. The remainder of the squad he split into two groups, going in opposite directions to work their way round the ring. Each laboratory was examined in turn, using electronic warfare blocks and infrared (in case Couteur was disguising herself as a piece of equipment). All the staff were tested and verified; they then had to leave their neural

nanonics open to the CNIS office overseeing the mission, to confirm they weren't being possessed after the marines left. One room at a time, and even scanning the corridor walls as they progressed. Murphy was leaving absolutely nothing to chance.

He led the group going counterclockwise from the door. The laboratory corridor might have been a much simpler geometry than Lalonde's jungle, denying her any real ambush opportunity, but he couldn't get rid of the old feeling that the enemy was right behind him. Several times he caught himself turning to stare past the marines following along behind. That wasn't good, because it made them jumpy, distracted. He concentrated hard on the curving space ahead, securing each empty room. Taking it a stage at a time, setting a proper example.

Despite the jumble of equipment in most labs, it was a simple enough task to scan their sensors round. The scientists and technicians inside were profoundly relieved to see them, although each welcome was subdued. Every time, they were checked out then sealed in.

The biological isolation facility, where Couteur had been held, was the ninth room Murphy visited. Its door had been forced half-way open, buckled metal runners preventing it from moving further. Murphy signalled the technical sergeant forward. He flattened himself against the wall, and gingerly extended a sensor block around the edge of the door.

"Clean sweep," the sergeant reported. "If she's in there, she's not in range."

It was a perfect double cover advance into the room. The marines deployed inside, scanning every centimetre as they went. A glass wall divided the room in half, with a large oval hole smashed through it. That, Murphy was expecting, along with the bodies torn by unpleasantly familiar deep char marks. There was a surgical table on the other side of the

glass, surrounded by equipment stacks. Tubes and wires were strewn around it, a complement to the limb restraint straps which hung limply over the edges where they'd been severed.

Who could really blame the occupant for breaking free? Murphy didn't appreciate being made to ask that question.

They left two sensor blocks behind to cover the broken door as they filed out, in case she returned. The next room, an office, had one of Couteur's other victims sprawled on the carpet. They scanned the corpse first, and applied the static sensor. Murphy wasn't going to be caught out that way.

But it was a genuine corpse, with a large number of small burns and several broken bones. A characteristics scan confirmed it was Eithne Cramley, one of the physics department technicians. Murphy was sure Couteur had tried to make Cramley submit to possession, but wouldn't have had enough time to make a success of the process. The rest of the room was empty. They sealed it and moved on.

It took ninety minutes for the two marine groups to meet up. All they'd found was six of the staff who didn't respond to Gilmore's datavise.

"Looks like she's lurking in the basement," he told them. He ordered ten marines to stand guard at the top of the stairs, and took the remainder down with him. This, he thought, was more her territory. The construction crew hadn't lavished the same kind of care down here as they had up in the ring of laboratories. They'd made it spacious enough, and well lit; but in the end it was just six caverns drilled in a line to house utility systems.

Again the marines deployed in perfect formation when they reached the bottom of the stairs. Murphy supervised them with growing unease. His heart rate now had to be regulated by his neural nanonics he was wired so tight, even the regenerated flesh on the fingers of his left hand was tingling

with phantom sensation. He just wished it was a reliable way of warning him a possessed was coming close. With each meter they advanced he was expecting Couteur to launch some vicious attack. He just couldn't understand what she was doing. Most likely scenario was that the three staff they hadn't located yet were now possessed. But she would know he'd be working on that assumption. There was nothing in this for her. Except being free of her bondage for a few hours. A reasonable enough impetus for most people. Murphy couldn't forget that voyage back to Trafalgar on the *Ilex*, the wearisome power struggle she'd waged against her captors the whole time. It hadn't taken him long to realize she'd allowed herself to be captured, making a mockery of poor old Regehr's terrible burns.

Advantage, that was her sole ambition, gaining the upper hand. This escape couldn't provide that for her. Not unless there was some enormity he'd overlooked. He felt as though his brain was being fossilised by the pressure of worry.

"Sir," the marine on point duty shouted. "Infrared signature."

They'd reached the environmental processing machinery. A hall of naked rock with seven big, boxy, air filter/regenerator units in a row down the centre. Pipes and ducts rose out from them in conical webs, leading away into glare of the overhead lighting panels. The marines were advancing along both sides of the bulky grey casings.

Someone was crouching down on top of the third, secreted amid a twist of metre-wide pipes. When Murphy switched his retinas to infrared, a distinctive thermal emission hazed around the edge of the pipes like a pink mist. Neural nanonics computed the output as consistent with a single person.

"Wrong," he muttered. His suit audio speaker boosted the word, sending it rumbling round the hall. Okay, she'd made

an effort to hide, but it was a pitiful one. Going through the motions. *Why?*

“Dr Gilmore?” Murphy datavised. “Is there any kind of super weapon she could have stolen from one of your laboratories?”

“Absolutely not,” Gilmore datavised back. “Only three portable weapons are undergoing examination in the laboratory. I verified their locations as soon as we knew Couteur had escaped.”

Another explanation gone, Murphy acknowledged miserably. “Encirclement,” he datavised to the squad. They began to fan out along the hall, keeping behind the pipes and machinery. When they had her surrounded he cranked the volume up further. “Come along, Jacqueline. You know we’re here, and we know where you are. Game over.” There was no visible response.

“Sir,” the technical sergeant said. “I’m picking up activity on the electronic warfare block. She’s increasing her energetic power.”

“Jacqueline, stop that right now. I have full shoot to kill authorization on this mission. You really have pissed off our top brass with these stunts of yours. Now take a good look at what you’re sitting on. That casing is all metal. We don’t even have to use our machine guns, I’ll just order someone to lob an EE grenade in your direction. You ought to know what electricity does to you by now.”

He waited a few seconds, then fired three rounds at the pipes just above the thermal emission. The bullets sliced a dim violet streak across his vision that vanished as soon as it began.

Jacqueline Couteur slowly stood up, hands raised high. She glanced round with supreme disdain at the marines crouched beneath her, their weapons gripped purposefully.

“Down on the ground, now,” Murphy ordered.

She did as she was told with insultingly measured slow-

ness; descending the rungs welded on to the side of the conditioner. When she reached the ground five marines advanced on her.

“On the ground,” Murphy repeated.

Sighing at how she’d been wronged she lowered herself to her knees, and slowly bent forward. “I trust this makes you feel safe?” she enquired archly.

The first marine to reach her shouldered his machine gun and took a holding stick from his belt. It telescoped out to two metres, and he closed the pincer clamp around Coureur’s neck.

“Scan and secure the rest of the hall,” Murphy instructed. “We’re still missing three bodies.”

He walked over to where Jacqueline Coureur was being held fast. The pincer was riding high on her neck, tilting her jaw back. It was an uncomfortable position, but she never showed any ire.

“What are you doing?” Murphy asked.

“I believe you’re in charge.” The tone was calculated to annoy, superior and amused. “You tell me.”

“You mean this is all you’ve achieved? Two hours’ liberty and you’re sulking about down here? That’s pathetic, Coureur.”

“Two hours tying up your resources, frightening your squad. And you, I can see the fear clouding your mind. Then I also eliminated several key CNIS science personnel. Possibly I engendered some more possessed to run loose in your precious asteroid. You’ll have to find that out for yourself. Do you really regard that as insignificant, lieutenant?”

“No, but it’s beneath you.”

“I’m flattered.”

“Don’t be. I’ll find out whatever scam you’re pulling, and I’ll blow it out the fucking airlock. You don’t fool me, Coureur.” Murphy pushed up his visor, and shoved his face centimetres from hers. “Zero-tau for you. You’ve abused our

decency for way too long. I should have shot you back on Lalonde.”

“No you wouldn’t,” she sneered. “As you said, you’re too decent.”

“Get her up to the lab,” Murphy snarled.

Gilmore was waiting for them at the top of the stairs; he directed them to professor Nowak’s laboratory where a couple of technicians had prepared a zero-tau pod. Jacqueline Couteur hesitated slightly when she saw it. Two machine guns prodded into the small of her back, urging her forwards.

“I ought to say sorry for any suffering you’ve undergone,” Gilmore said awkwardly. “But after the courtroom, I feel completely vindicated.”

“You would,” Jacqueline said. “I shall be watching you from the beyond. When your time comes to join us, I’ll be there.”

Gilmore gestured at the zero-tau pod, as if getting in was voluntary. “Empty threats, I’m afraid. By that time, we shall have solved the problem of the beyond.”

Couteur gave him a final withering glance, and climbed into the pod.

“Any final message?” Murphy asked. “Children or grandchildren you want to say something to? I’ll see it’s passed on.”

“Go fuck yourself.”

He grunted and nodded to the technician operating the pod. Couteur was immediately smothered beneath the jet-black field.

“How long?” Murphy asked tensely. He still couldn’t believe this was all there was to it.

“Leave her in for at least an hour,” Gilmore said with bitter respect. “She’s tough.”

“Very well.” Murphy refused to allow the door connecting the secure laboratory with the rest of the asteroid to be

re-opened, not with three people still unaccounted for. The marines continued their sweep of the utility caverns. As well as people, Murphy had them examine the fusion generators. Since the loss of the external heat exchangers, they'd been operating in breakeven mode, shunting their small thermal output into the emergency heat storage silo. Couteur couldn't rig them to explode, but the plasma could do a lot of damage if the confinement field had been tampered with.

The technicians reported back that they were untouched. After another forty minutes one of the missing bodies was found, dead, and stuffed behind an air conditioning vent. Murphy ordered the squad to go back through the rooms they'd covered and open all the remaining grilles, no matter what size. A possessed could easily hollow out a small nest for themselves in the rock.

He waited seventy minutes before ordering the zero-tau pod to be switched off. The woman inside was wearing a tattered and burnt laboratory tunic with the CNIS insignia on her shoulder. She was weeping fervently as she tottered out, clutching at a bloody wound across her abdomen. Murphy's characteristics recognition program identified her as Toshi Numour, one of the weapons section's biophysics researchers.

"Shit," Murphy groaned. "Dr Gilmore," he datavisd. There was no reply. "Doctor?" The communications processors in the secure laboratory complex reported they couldn't acquire Dr Gilmore's neural nanonics.

Murphy burst out into the main corridor, and shouted at his squad to follow. With ten suited figures clattering along at his heels, he sprinted for Gilmore's office.

As soon as the black shell of the zero-tau field had snapped up around Jacqueline Couteur, Pierce Gilmore headed back for his office. He didn't protest at Hewlett's continuing restrictions in preventing them from leaving the secure labora-

tory complex. In fact, he rather approved. He'd received a nasty shock when Couteur escaped, on top of the asteroid physically shaking in the wake of the antimatter blast. Under the circumstances, such precautions were both logical and sensible.

The office door slid shut behind him, and some of the lighting came on. Current power rationing permitted him only four of the ceiling panels, the kind of light provided by a cold winter afternoon. None of the holographic windows were active.

He walked over to the percolator jug, which was still bubbling away contentedly, and poured himself a cup. After a moment of regret, he switched it off. There probably wouldn't be enough space in his evacuation allocation to take it or any of the bone china cups with him. Assuming there would be any allocation for personal effects. With over three hundred thousand people to evacuate in a week, the amount of baggage they could take with them would be minimal to zero.

The small solaris tube running above his orchids was also off. Several of the rare pure-genotype plants were due to flower, their fleshy buds had almost burst. They never would now. There would be no light and fresh air, and the heat would arrive soon. The secure laboratory was closer to the surface than most of the asteroid's habitable sections, it would receive the worst of the inward seepage. Furniture, equipment, it would all be lost. The only thing to survive would be their files.

Pierce sat behind his desk. In fact, he really ought to be drawing up procedures to safeguard the information ready for when they transferred to their secondary facility. He put his cup down on the leather surface, next to an empty cup. That hadn't been there before.

"Hello, Doctor," Jacqueline Couteur said.

He did flinch, but at least he didn't jump or yelp. She

didn't have the satisfaction of witnessing any disconcertion, which in the game they played was a big points winner. His eyes locked on an empty section of wall directly ahead, refusing to turn round and look for her. "Jacqueline. You have no feelings. Poor Lieutenant Hewlett really won't enjoy being outsmarted in this manner."

"You can stop trying to datavise for help now, Doctor. I disabled the room's net processors. Not with my energistic power, either, there was no glitch to alert the AI. Kate Morley had some knowledge of electronics, a couple of old didactic courses."

Pierce Gilmore datavised the comprehensive processor array installed in his desk. It reported that its link with Trafalgar's communication's net had been removed.

Jacqueline chuckled softly as she walked round the desk into his line of sight. She was carrying a processor block, its small screen alive with graphics that monitored his datavises. "Anything else you'd like to try?" she enquired lightly.

"The AI will notice the processors have gone off line. Even if it isn't caused by a glitch, a marine squad will be sent to investigate."

"Really, Doctor? A lot of systems were damaged by the EM pulse. I've apparently been caught and shoved into zero-tau, and the marines have already cleared this level. I think that gives us time enough."

"For what?"

"Oh dear me. Is that finally a spike of fear I sense in your mind, Doctor? That has got to be the first arousal of any kind you've had for many a year. Perhaps it's even a hint of remorse? Remorse for what you put me through."

"You put yourself through it, Jacqueline. We asked you to cooperate; you were the one who chose to refuse. Very bluntly, as I recall."

"Not guilty. You tortured me."

“Kate Morley. Maynard Khanna. Should I go on?”

She stood directly in front of the desk, staring at him. “Ah. Two wrongs making a right? Is that what I’ve reduced you to, Doctor? Fear does things to the most brilliant of minds. It makes them desperate. It makes them pitiful. Is there any other excuse you’d like to offer?”

“If I was facing a jury, good and true, I could offer several justifications. Such arguments would be wasted on a bigot.”

“Petty, even for you.”

“Cooperate with us. It’s not too late.”

“Not even clichés change in five hundred years. That says quite a lot about the human race, don’t you think? Certainly everything I need to know.”

“You’re transferring onto an abstract concept. Self-hatred is a common aspect of a diseased mind.”

“If I’m the one that’s ill and incapable, how come you’re the one in terminal trouble?”

“Then stop being the problem, and help us with a solution.”

“We are not *problems*.” Her hand slammed down on the front of the desk, making the two coffee cups jump. “We are people. If that simple fact could ever register in that fascist bitek brain of yours then you might be able to look in a different direction, one that would help bring an end to our suffering. But that is beyond you. To think along those lines you have to be human. And after all these weeks of study, the one definite conclusion I have come to, is that you are not human. Nor can you ever become human. You have nothing, no moral foundation from which to grow out of. Laton and Hitler were saints compared to you.”

“You’re taking your situation far too personally. Understandably, after all, you can hardly retreat from it. You lack the courage for that.”

“No.” She straightened up. “But I can make my last noble stand. And depriving the Confederation Navy of your so-

called talent will be a satisfactory achievement for me. Nothing personal, you understand.”

“I can put an end to this, Jacqueline. We’re so very close to an answer now.”

“Let’s see how your rationality endures the reality of the beyond. You will now experience every facet of it. Being possessed by one of its inhabitants; living within it, and if you’re really fortunate, as a possessor, forever terrified that some lucky living bastard is going to rip you out of your precious new prize and send you back screaming. What will your answer be then, I wonder?”

“Unchanged.” He gave her a sad defeated smile. “It’s called resolution, the ability and determination to see things through to the end. However unexpected or disappointing that end turns out to be. Not that anyone will ever know now. But I held true to myself.”

Alarmed by his mind tone, Jacqueline started to point her right arm. Slivers of white fire licked up from her wrist.

In Gilmore’s mind the alternatives were stark. That she would torture him was inevitable. He would be possessed, or more likely damaged so badly that his body died, banishing his soul to the beyond. That was where logic broke down. He believed, or thought he did, that there was a way out of the beyond. Doubt undermined him, though. Factious, unclean human emotion, the type he hated so. If a way through the beyond existed, why did the souls remain trapped? There was no certainty any more. Not for him, not there. And he couldn’t stand that. Facts and rationality were more than the building blocks of his mind, they were his existence. If the beyond was truly a place without logic, then Pierce Gilmore had no wish to exist there. And his own sacrifice would advance human understanding by a fraction. Such knowledge was a fitting last thought.

He datavised the processor array for the latest version of the anti-memory. Jacqueline’s hand was already lining up

desperately on him when the desktop AV projection pillar silently pumped a blindingly pervasive red light across the office.

Sixty minutes later Murphy Hewlett and his squad blew the office door out with an EE charge, and rushed in to the rescue. They found Gilmore slumped over his desk, and Kate Morley lying on the floor in front of it. Both of them were alive, but completely unresponsive to any kind of stimulus the squad medic could apply. As Murphy said later during his debriefing, they were nothing but a pair of wide awake corpses.

18

From the safety of the little plateau, a quarter of the way up the northern endcap, Tolton trained his telescope on the lobby of the Djerba starscraper. Another swirl of darkness was pushing up through the dome of white archways. Pieces of the structure tumbled across the crumpled lawn circling the forlorn building. He kept expecting to hear the sound of breaking glass reach across the distance. The telescope provided a good, sharp image, as if he was just a few metres away. He shivered at that errant thought, still able to feel the wave of coldness that had swept through him every time the flying monster passed overhead.

“This one’s a walker.” He moved aside and let Erentz use the telescope’s eyepiece.

She studied it for a minute. “You’re right. It’s picking up speed, too.” The visitor had shoved its way through the smouldering ruins of the shanties, leaving a deep furrow in its wake. Now it was traversing the meadows beyond. The wispy pink grass stalks around it turned black, as if they’d been singed. “Moving smoothly enough; fast, too. It should reach the southern endcap in five or six hours at that rate.”

Just what we need, the personality grouched. Another of the buggers leeching off us. We'll just have to reduce nutrient fluid production to survival minimum, keep the neural strata alive. That'll play hell with our main mitosis layer. It'll take us years to regenerate the damage.

Eight of the dire visitors had now emerged from the Djerba, three of them taking flight. Without fail, they had headed for the southern endcap, just as the first and largest had done. Those that moved over the land had left a contrail of dead vegetation behind them. When they reached the endcap, they bored their way through the polyp and into the arteries which fed the giant organs, suckling the nutrient fluid.

"We should be able to burn them out soon," she said. "The flame throwers and incendiary torpedoes are coming on fine. You'll be okay."

The look Tolton gave her made his lack of affinity irrelevant. He bent over the telescope again. The visitor was crunching its way through a small forest. Trees swayed and toppled, broken off at the base. It seemed incapable of going round anything. "That thing is goddamn strong."

"Yeah." Her worry was pronounced.

"How's the signal project coming?" He asked the question several times every day, frightened he might miss out on some amazing breakthrough.

"Most of us are working on developing and producing our weapons right now."

"You can't give up on that. You can't!" He said it loud for the benefit of the personality.

"Nobody's giving up. The physics core team is still active." She didn't tell him it was down to five theorists who spent most of their time arguing about how to proceed.

"Okay then."

Two more are approaching, the personality warned.

Erentz gave the street poet a swift glance. He was engrossed with the telescope again, tracking the movements of the visitors still loose on the grass plains. **No need to panic the others.**

Quite.

The creatures had been arriving at the rate of nearly one every half hour ever since Erentz's disastrous foray into the Djerba. The personality was now worried about its ability to maintain the habitat's environmental integrity. Each new arrival invariably smashed its way into a starscraper, then proceeded to hammer the tower's internal structure. So far the emergency inter-floor pressure seals had held. But if the invasion continued at this rate a breach was inevitable.

We believe some of the incumbents are now starting to move, the personality said. **It's slow, which makes it hard to tell, but they could start to emerge into the parkland within in the next day or so.**

Do you think they're multiplying like the first one did?

Impossible to tell. Our perception routines close to them are almost completely inviolable now. We suspect a great deal of the polyp is dead. However, if one did, then it is logical to assume the others will follow that pattern.

Oh great. Oh shit. We're going to have to tackle each one separately. I'm not even sure we can win. The numbers are starting to stack up against us.

We will have to review our tactics after the first few encounters. If the expenditure is too great then we may adopt Tolton's wishes and deploy everyone on the signal project.

Right. She let out a beaten sigh. **You know, I don't even consider that defeatist. Anything which gets us out of this is fine by me.**

A healthy attitude.

Tolton straightened up. "What next?"

"We'd better get back down to the others. The visitors aren't immediately threatening."

"That can change."

"If it does, I'm sure we'll know about it real soon."

They walked into the small cave at the back of the plateau. It housed a tunnel which spiralled down through several chambers to the caverns at the base of the endcap. Wave escalators and stairs were arranged in parallel down each level. Most of the wave escalators had stopped, so the descent took them quite a while.

The caverns had taken on the aspect of a fort under siege. Tens of thousands of people lay ill on whatever scraps of bedding were available. There was no order to the way they were arranged. Nursing the bedridden was left entirely to those slightly less ill, and consisted mainly of taking care of their sanitary needs. Those qualified (or with basic how-to didactic memories) to operate medical packages circulated constantly, perpetually exhausted.

Erentz's relatives had formed an inner coterie in the deepest caverns, where the light manufacturing tools and research equipment were concentrated. They'd also taken care to stockpile their own food supply, which could last them for well over a month. Here at least, a semblance of normality remained. Electrophorescent strips shone brightly in the corridors. Mechanical doors whirred open and shut. The clatter of industrial cybernetics vibrated along the polyp. Even Tolton's processor block let out a few modest bleeps as basic functions returned to life.

Erentz let him into a chamber serving as an armoury. Her relatives had been busy since the reconnaissance in the Djerba, designing and producing a personal flame thrower. The basic principal hadn't changed much in six hundred years: a chemical tank carried on the user's back, with a

flexible hose leading to a slim rifle-like nozzle. Modern materials and fabrication techniques allowed for a high pressure system, giving a narrow flame that could reach over twenty metres, or be switched to a wide short-range cone. Scalpel or blunderbuss, Erentz commented. There were also incendiary torpedo launchers; essentially scaled-up versions of an emergency flare.

She started into discussions with several of her relatives, mostly using affinity. Only a few exclamations were actually voiced. Tolton felt like a child left out of abstruse adult conversation. His attention wandered off. Surely the personality wouldn't expect him to join the combatants fighting the dark creatures? He lacked the kind of driven intensity Erentz and her relatives flaunted, their birthright. He was afraid to ask in case they said yes. Worse, they could say no and kick him out of their caverns to rejoin the rest of the population.

There must be some important non-combatant post he could fill. He raised his processor block to type an unobtrusive question for the personality. The Rubra of old would sympathise with that, and the Dariat section was his friend. Then he realized Erentz and her cousins had stopped talking.

"What?" he asked nervously.

"We can sense something in the rail tube approaching one of the endcap stations," the block said. It was essentially the same voice Rubra had used to speak with him the whole time he was in hiding; though something about it had changed. A stiffness in the inflexion? Minor yet significant.

"One of them's coming here?"

"We don't believe so. They rampage about without any attempt to disguise themselves. This is more like a mouse sneaking along. None of the surrounding polyp is suffering the usual heat-loss death. But our perceptive cells are unable to obtain a clear image."

"The bastards have changed tactics," Erentz snarled. She

snatched one of the flame throwers from a rack. "They know we're here!"

"We are uncertain on that point," the personality said. "However, this new incursion will have to be investigated."

Several more people ran into the armoury, and began picking up weapons. Tolton watched the abrupt whir of activity with bewildered alarm.

"Here." Erentz thrust an incendiary torpedo launcher at him.

He grabbed it in reflex. "I don't know how to use this."

"Aim it and shoot. Effective range two hundred metres. Any questions?"

She didn't sound in a forgiving mood.

"Oh crap," he grunted. He rocked his head from side to side, attempting to force the stiffness out of his neck muscles, then joined them in the hurried exodus.

There were nine of them in the group which marched down the stairs to the endcap tube station. Eight of Rubra's heavily armed, grim-faced descendants; and Tolton hanging as close to the back of the pack as possible while trying not to make it too obvious.

The main lighting strips were dark and cold. Emergency panels flickered with sapphire phosphorescence as if stirred into guilty life by the clumping footsteps. Not that they were of much use. Helmet projectors encased each member of the group in a sphere of bright white light. So far their power cells were unaffected.

"Any change?" Tolton whispered.

"No," the block whispered back. "The creature is still moving along the tube tunnel."

Rubra hadn't damaged this particular station during the brief active phase of his conflict with the possessed. Tolton kept expecting everything to return to life in a blast of light and noise and motion. It was *Marie Celeste* territory. A car-

riage was standing abandoned at one of the twin platforms, its door open. A couple of fast food packets lay abandoned on the marble floor outside, their contents dissolved into a pellicle of grey mould.

Erentz and her cousins fanned out along the platform, and edged cautiously towards the blank circle of the tunnel mouth behind the carriage. Three of them dropped down onto the rail, and crossed swiftly to the far wall. They slunk back into various crannies, crouched down, and aimed their weapons forward.

Along with those remaining on the platform, Tolton secured himself behind one of the central pillars, and brought his launcher up. Nine helmet projectors focused their illumination on the tunnel entrance, banishing the shadows for several metres along its length.

“This isn’t exactly an ambush,” he observed. “It can see we’re here.”

“Then we find out just how determined they are to get at us,” Erentz said. “I tried the subtle approach back in the Djerba. Believe me, it’s a bunch of shit.”

Wondering just how much their definitions of subtle were at variance, Tolton tightened his grip on the launcher. Once again, he checked the safety catch.

“Getting close now,” the personality cautioned.

A speck of grey materialized at the furthest extreme of the tunnel’s shadows. It rippled as it moved steadily forwards towards the station.

“Different,” Erentz muttered. “It’s not concealing itself this time.” Then she gasped as the habitat’s sensitive cells finally managed to focus.

Tolton squinted at the slowly resolving shape, pointing his launcher to the vertical so he could strain ahead. “Holy shit,” he said quietly.

Dariat emerged from the tunnel mouth, and smiled softly at the semicircle of lethal nozzles pointing at him

out of the blazing light. "Something I said?" he asked innocently.

You should have identified yourself to us, the personality said in censure.

I have been busy thinking, discovering what I am.

And that is?

I'm not quite sure yet.

Tolton whooped happily, and emerged from behind his pillar.

"Careful!" Erentz warned.

"Dariat? Hey, is that you?" Tolton hurried along the platform, grinning madly.

"It's me." There was only a slightly sardonic tone colouring his voice.

Tolton frowned. He'd heard his friend's voice loud and clear, never even needing to concentrate on the lip movement. He came to a confused halt. "Dariat?"

Dariat put his hands flat on the platform edge, and heaved himself up like a swimmer emerging from a pool. It looked like a lot of effort to lift so much weight. His toga stretched tight over his shoulders. "What's up, Tolton? You look like you've seen a ghost." He chuckled as he walked forward. The frayed hem of his toga brushed against one of the fast-food packets, and sent it spinning.

Tolton stared at the rectangle of plastic as it skidded to a halt. The others were bringing their weapons to bear again.

"You're real," Tolton stammered. "Solid!" The obese grinning man standing in front of him was no longer translucent.

"Damn right. The Lady Chi-Ri smiled on me. A warped kind of smile, I guess, but definitely a smile."

Tolton reached out gingerly and touched Dariat's arm. Cold bit into his questing fingers like razor fangs. He snatched his hand back. But there had definitely been a

physical surface; he'd even felt the crude weave of the toga cloth. "Shit! What happened to you, man?"

"Ah, now there's a story."

"I fell," Dariat told them. "Ten bloody stories down that lift shaft, screaming all the way. Thoale alone knows why suicides are so fond of jumping off cliffs and bridges; they wouldn't if they knew what that trip's like. I'm not even sure I did it on purpose. The personality was bullying me to do it, but that thing was getting closer, which made me weaker. I probably lost control of my legs I was so debilitated. Whatever . . . I went over the edge and landed smack on top of the lift. I even penetrated it a few centimetres I was falling so hard. Shit, I hate that. You've no idea how bad solid matter feels to a ghost. Anyway, I was just forcing my legs through the lift's roof to get out of there when the bloody bogeyman lands right bang beside me. I could even feel it coming, like a gust of liquid helium blowing down the shaft. But the thing is, it didn't break when it hit. It splashed."

"Splashed?" Tolton queried.

"Absolutely. It was like a goo bomb detonated on top of the lift. The whole shaft was splattered in this thick fluid. Everything got coated, including me. But the fluid reacted to me, I could feel the droplets. It was like getting caught in a spray of ice."

"How do you mean, reacted?"

"They changed while they were going through me. Their shape and colour tried to match the section of my body they were in. I figured it's like my thoughts have a big influence over them. I'm imagining my shape, right. So that imagination interacts with the fluid and formats it."

"Mind over matter," Erentz said sceptically.

"You got it. Those creatures are no different from any human ghost, except they're made up of this fluid; a solid visualization. They're souls, just like us."

“So how come you became solid?” Tolton asked.

“We fought for it, me and the other entity’s soul. The impact made it lose concentration for a moment, that’s why the stuff went flying off. Both of us started scrambling round to suck up as much as we could. And I was a hell of a lot stronger than it was. I won. Must have got seventy per cent of what was there before I made a run for it. Then I hid in the bottom floors until the rest of them had gone.” He looked round the circle of faintly suspicious faces. “That’s why they’ve come here. Valisk is saturated with energy that they can use. It’s the kind of energy that makes up our souls, life-energy. The attraction is like a bee for pollen. This is what they crave; they’re sentient just like us, they’ve come from the same universe as us, but blind instinct rules them now. They’ve been here so long they’re severely diminished, not to mention totally irrational. All they know is that they have to feed on life-energy, and Valisk is the biggest single source to emerge here that they can remember.”

“That’s what they were doing to the nutrient fluid,” the personality said. “Absorbing the life-energy from it.”

“Yeah. Which is what trashes it. And once it’s gone, you’ll never be able to produce any more. This dark continuum is like a bedamned version of the beyond.”

Tolton slumped onto the bottom stair. “Just fucking great. This is worse than the beyond?”

“I’m afraid so. This must be the sixth realm, the nameless void. Entropy is the only lord here. We will all bow down before him in the end.”

“This is not a Starbridge realm,” the personality retorted sharply. “It’s an aspect of physical reality, and once we understand and tabulate its properties we will know how to open a wormhole interstice and escape. We’ve already put a stop to these creatures consuming any more of us.”

Dariat glanced suspiciously round the empty station. “How?”

“The habitat’s nutrient fluid arteries have been shut down.”

“Uh oh,” Dariat said. “Bad move.”

With their nourishment denied them, the Orgathé began to search round for further sources of raw life-energy, crying out in their own strange intangible voices. Their kith who had infested the southern endcap organs shrilled in reply. Even there, the rich fluids were drying up, but the organs themselves were suffused with a furnace glow of life-energy. Enough for thousands.

The Orgathé pummelled their way up through the starscrapers one by one, and took flight.

Dariat, Tolton, Erentz, and several others stood outside one of the endcap caverns they were using as a garage for the rentcop trucks. They shielded their eyes from the bruised tangerine nimbus of the light-tube to watch one of the dark colossi soar upwards from a collapsing lobby. With its tattered wing sails extended, it was bigger than a cargo spaceplane. A small pearl-white twister of hail and snow fell from its warty underbelly.

Erentz puffed a relieved breath out through her teeth. “At least they’re still heading for the southern endcap.”

There are over thirty of them gnawing their way through our organs now, the personality said. The damage they are inflicting is reaching dangerous levels. And there’s only a single pressure door in the Igan starscraper preventing an atmosphere breach. You will have to go on the offensive. Dariat, will the flame throwers kill them?

No. Souls cannot be killed, even here. They just fade away to wraiths, maybe shadows not even that strong.

You know what we mean, boy!

Yeah, sure. Okay, the fire will fuck with their constituent fluid. They’re taking a long time to acclimatize

to the heat levels in the habitat. We're Thoale alone knows how many thousands of degrees above the continuum's ambient.

You mean hundreds.

I don't think so. Anyway, they can't take a direct blast of physical heat. Lasers and masers they can simply deflect, but flame should dissipate the fluid and leave their souls naked. It'll turn them into another just bunch of ghosts skulking round the parkland.

Excellent.

"If they can't die, what do they want with all that life-energy?" Erentz asked.

"It boosts them above the rest," Dariat said. "Once they're strong, they'll stay free for a long time before the life-energy leaks away again."

"Free of what?" Tolton asked uneasily. He had to stand several paces away from his friend. Not out of rudeness; Dariat was *cold*. Moisture condensed across his toga as it would on a beer bottle fresh from the fridge. None of the droplets stained the cloth, though, Tolton noticed. And that was only one of the oddities this reincarnation displayed. There were differences in behaviour, too, little quirks which had come to the fore. He'd watched Dariat quietly as they'd all walked up out of the tube station. There was a confidence about him that had been missing before; as if he was merely indulging his relatives rather than helping them. That deep anger had been expelled, too, replaced by sadness. Tolton wondered about that combination, sadness and confidence was a strange driving force. Probably quite volatile, too. But then given what poor old Dariat had been through in the last few weeks, that was eminently forgivable. Worthy of a verse or two, in fact. It had been a long time since Tolton had composed anything.

"We didn't have a real long conversation on top of the lift," Dariat said. "It was the kind of pressurized memory ex-

change I experienced in the beyond. The creature's thoughts weren't very stable."

"You mean it knows about us?"

"I expect so. But don't confuse knowing with being interested. Absorbing life-energy is all they exist for now."

Erentz squinted after the receding Orgathé as it headed over the circumfluous sea. "We'd better get organized, I suppose." She couldn't have sounded less enthusiastic.

Dariat gave up on the dark invader, and looked around. A crowd of ghosts was hanging back from the cavern entrance, keeping among the larger boulders littering the desert. They regarded the little band of tenacious corporeal humans with grudging respect, avoiding direct eye contact like a shoplifter eluding the store detective.

"You!" Dariat barked suddenly. He started to march over the powdery sand. "Yes, you, shithead. Remember me, huh?"

Tolton and Erentz trailed after him, curious at this latest behaviour.

Dariat was closing on a ghost dressed in baggy overalls. It was the mechanic he'd encountered when he went searching for Tolton just after the habitat arrived in the dark continuum.

Recognition was mutual. The mechanic turned and ran. Ghosts parted to let him through their midst. Dariat chased after him, surprisingly fast for his bulk. As he passed through the huddle of ghosts they shivered and shuffled further away, gasping in shock at the cold he exuded.

Dariat caught hold of the mechanic's arm, dragging him to a halt. The man screeched in pain and fear, flailing about, unable to escape Dariat's grip. He started to grow more transparent.

"Dariat," Tolton called. "Hey, come on, man, you're hurting him."

The mechanic had fallen to his knees, shaking violently as

his colouring bled away. Dariat by contrast was almost glowing. He glowered down at his victim. "Remember? Remember what you did, shithead?"

Tolton drew up short, unwilling to touch his erstwhile friend. The memory of the cold he'd experienced back in the station was too strong.

"Dariat!" he shouted.

Dariat looked down at the mechanic's withering face. Remorse opened his fingers, allowing the incorporeal arm to slip away. What would Anastasia say about such behaviour? "Sorry," he muttered shamefully.

"What did you do to him?" Tolton demanded. The mechanic was barely visible. He'd curled up into a foetal position, half of his body sunk into the sand.

"Nothing," Dariat blurted, ashamed of his action. The fluid which brought him solidity apparently came with an ugly price. He'd known it all along, simply refused to acknowledge it. Hatred had been an excuse, not a motivator. As with the Orgathé instinct was supplanting rationality.

"Oh, come on." Tolton bent down and moved his hand through the whimpering ghost. The air felt slightly cooler, otherwise there was no trace that he existed. "What have you done?"

"It's the fluid," Dariat said. "It takes a lot to maintain myself now."

"A lot of what?" Rhetorical question: Tolton knew without needing an answer.

"Life-energy. Just keeping going uses it up. I need to replenish. I don't have a biology, I can't breathe or eat a meal; I have to take it neat. And souls are a strong concentration."

"What about him?" A tiny patina of silver frost was forming on the ground within the ghost's vague outline. "What about this particular *concentration*?"

"He'll recover. There's plants and stuff he can recoup the loss from. He did a lot worse to me, once." No matter how

much Dariat wanted, he couldn't look away from the drained ghost. This is what we're all going to end up like, he acknowledged. Pathetic emancipated remnants of what we are, clinging to our identity while the dark continuum depletes us until we're a single silent voice weeping in the night. There's no way out. Entropy is too strong here, drowning us away from the light.

And I was instrumental in bringing us here.

"Let's get back inside," Erentz said. "It's about time we put you under the microscope, see if the physics gang can make any sense of you."

Dariat thought about protesting. Eventually he just nodded meekly. "Sure."

They walked back towards the cavern entrance, through the clutter of subdued ghosts. Two more Orgathé hatched from the Gonchraov starscraper lobby, tumbling up into the wan twilight sky.

There were vigilantes at Kings Cross station, hard young gang members drafted in from the low-cost residential estates scattered around the outer districts of Westminster Dome. Their uniforms went from pseudo-military to expensive business suits, denoting their differing membership. Ordinarily such a mixture was hypergolic. See/kill. And if civilians got caught in the line of fire, tough. In some cases, feuds between boroughs and individual gangs went back centuries. Today, they all wore a simple white ribbon prominently on their various lapels. It stood for Pure Soul, and united them in commitment. They were here to make sure all of London stayed pure.

Louise stepped off the vac-train carriage, yawning heavily. Gen leaned against her side, nearly sleepwalking as they moved away from the big airlock door. It was almost three in the morning, local time. She didn't like to think how long she'd been up for now.

“What are you creeps doing getting off here?”

She hadn't even noticed them until they stood in front of her. Two dark-skinned girls with shaved heads; the taller one had replaced her eyeballs with blank silver globes. Both of them wore identical plain black two-piece suits of some satin fabric. They didn't have blouses; the jackets were fastened by a single button, exposing stomachs as muscular as any Norfolk field labourer. Their cleavage was the only way to tell they were female. Even then Louise wasn't entirely sure, they might just be butched-up pectorals.

“Uh?” she managed.

“That train's from Edmonton, babe. That's where the possessed are. Is that why you left? Or are you here for some other reason, some kind of freako nightclub?”

Louise began to wake up fast. There were a lot of young people on the platform; some dressed in suits identical to the girls' (the voice finally convinced her about gender), others in less formal clothes. None of them showed any inclination to embark on the newly arrived train. Several armour-suited police were clumped round the exit archway, with their shell—helmet visors raised. They were looking in her direction with some interest.

Ivanov Robson moved smoothly to stand at Louise's side, his movement hinting at the same kind of inertia carried by an iceberg. He smiled with refined politeness. The gang girls didn't flinch, exactly, but they were smaller now, somehow, less menacing.

“Is there a problem?” he asked quietly.

“Not for us,” the one with the silver eyes said.

“Good, then please stop hassling these young ladies.”

“Yeah? So what are you, their dad? Or maybe just their great big friend out for some fun tonight.”

“If that's the best you can do, stop trying.”

“You didn't answer my question, bigfoot man.”

"I'm a London resident. We all are. Not that it's any of your concern."

"Like fuck it isn't, brother."

"I'm not your brother."

"Is your soul pure?"

"What are you all of a sudden, my confessor?"

"We're guardians, not priests. Religion is fucked; it doesn't know how to fight the possessed. We do." She patted her white ribbon. "We keep the arcology pure. No shitty little demon gets in past us."

Louise glanced across at the police. There were a couple more of them now, but they showed no sign of intervening. "I'm not possessed," she said indignantly. "None of us are."

"Prove it, babe."

"How?"

The gang girls both took small sensors from their pockets. "Show us you contain only one soul, that you're pure."

Ivanov turned to Louise. "Humour them," he said in a clear voice. "I can't be bothered to shoot them; I'd have to pay the judge far too much to bounce us out of jail before breakfast."

"Fuck you," the second gang girl shouted.

"Just get on with it," Louise said wearily. She held out her left arm, the right was curled protectively round Gen. The gang girl slapped the sensor on the top of her hand.

"No static," she barked. "This is a pure babe." Her follow-up grin was weird, showing teeth that were too long to be natural.

"Check the sprog."

"Come on, Gen," Louise coaxed. "Hold out your hand." A scowling Genevieve did as she was told.

"Clean," the gang girl reported.

"Then you must be what I can smell," Genevieve scoffed. The gang girl drew her hand back for a slap.

"Don't even dream it," Ivanov purred.

Genevieve's face slowly broke into a wide smirk. She looked straight at the girl with the silver eyes. "Are they lesbians, Louise?"

The gang girl had trouble controlling her temper. "Come with us, little girl. Find out what we do to freshmeat like you."

"That's enough." Ivanov stepped forward and proffered his hand. "Genevieve, behave, or I'll smack you." The gang girl put her sensor to his skin, taking care to do it softly.

"I've met a possessed," Genevieve said. "The nastiest one there's ever been."

Both gang girls gave her an uncertain look.

"If a possessed does ever comes out of a train, you know what you should do? Just run. Nothing you can do will stop them."

"Wrong, titchy bitch." The gang girl patted a pocket; there was something heavy bulging the fabric. "We just pump them with ten thousand volts and watch the firework display. I've heard it's real pretty. Be good to me, I'll let you watch, too."

"Seen it already."

"Huh!" The girl turned her silver eyes on Banneth. "You too. I want to know you're pure."

Banneth laughed gently. "Let's hope your sensor can't probe my heart."

"What the hell are you all doing here?" Ivanov asked. "The only time I've seen the Blairs and the Bennis in the same place before was a morgue. And I can see a couple of MoHawks over there as well."

"Looking after our turf, brother. These possessed, they're part of the sect. You don't see none of those bastards down here, do you? We're not going to let them crunch us like they done New York and Edmonton."

"I think the police will do that, don't you?"

"No fucking way. They're Govcentral. And those shits let

the possessed down here in the first place. This planet's got the greatest defences in the galaxy, and the possessed just breezed through them like they weren't even there. You want to tell me how come that happened?"

"Good point," Banneth drawled. "I'm still waiting to hear on that one myself."

"And why haven't they shut down the vac-trains properly?" the girl continued. "They're still running to Edmonton where we know the possessed are. I accessed that sensewise of the fight, it was only a couple of hours ago for Christ's sake."

"Criminal," Banneth agreed. "They were probably bribed by big business."

"You taking the piss, bitch?"

"Who, me?"

The gang girl gave her a disgusted stare, not knowing what to make of her attitude. She jerked her thumb over her shoulder. "Go on, get the fuck out of here, all of you. I hate you rich kinks." She watched them walk through the exit archway with a vague sense of unease scratching away at her mind. There was something badly wrong about the group, the four of them were a complete mismatch. But screw that, as long as they weren't possessed who cared what kind of orgy they were heading off to. She shivered suddenly as a cold breeze swept along the platform. It must have been caused by the carriage airlocks swinging shut.

"That was awful," Genevieve exclaimed when they reached the big sub-level hall above the station's platforms. "Why didn't the police stop them doing that to people?"

"Because it's way too much trouble at three o'clock in the morning," Ivanov said. "Besides, I expect most of the officers down there are quite happy to let the vigilantes take the

heat if a possessed did step out of a train. They act as a buffer.”

“Is Govcentral being stupid allowing the vac-trains to continue?” Louise asked.

“Not stupid, just slow. It is the universe’s largest bureaucracy, after all.” He waved a hand at the informationals flittering overhead. “See? They’ve shut a few routes down already. And public pressure will close a lot more before long. It’ll snowball once everyone’s had time to access the Edmonton fight. This time tomorrow you’ll have trouble getting a taxi to take you further than a couple of streets.”

“Do you think we’ll be able to leave London again?”

“Probably not.”

The way he said it sounded so final: a pronouncement rather than an opinion. As always, an authority in knowledge he had no business knowing.

“All right,” Louise said. “I suppose we’d better go back to the hotel, then.”

“I’ll come with you,” Ivanov said. “There might be a few more of these nutters around. It wouldn’t do for the natives to learn you’re from Norfolk right now. These are paranoid times.”

For some reason, Andy Behoo popped into Louise’s mind; his offer to sponsor her for Govcentral citizenship. “Thank you.”

“What about you?” Ivanov asked Banneth. “Do you need to share a cab?”

“No thank you. I know where I’m going.” She walked off towards the lifts around the rim of the hemispherical cavern.

“Don’t mention it,” Louise muttered grumpily at her back.

“I expect she’s grateful, really,” Ivanov said. “Probably just doesn’t know how to express it.”

“She could try harder.”

“Come along, let’s get you two home to bed. It’s been a long day.”

Quinn watched the lift doors close on Banneth. He didn’t bother to rush after her. Finding her again would be relatively simple. Bait was never hidden. Oh, it wouldn’t be obvious. He would need time, and resources, and have to make an effort. But her location would be filtered through the arcology’s downtowners, the sect covens and gangs would be informed. That was why he’d been lured here, after all. London was the largest, most elaborate trap ever assembled for one man. In a strange way, he felt rather flattered. That the supercops were prepared to sacrifice the whole arcology just to nail him was a mark of extreme respect. They feared God’s Brother exactly as He should be feared.

He trailed after Louise as she walked over to the lifts with her brat sister and the huge private eye. She was very drowsy, which relaxed her face. It left her delicate features unguarded and natural; a state which served only to amplify her beauty. He wanted to put out a hand and stroke her exquisite cheeks, to see her smile gently at his touch. Welcome him.

She frowned, and rubbed her arms. “It’s cold down here.” The moment broke.

Quinn rode up to the surface with the trio, then left them as they went off to the taxi garage. He took a subwalk under the busy road and hurried along one of the main streets radiating out from the station. There would only be a limited amount of time until the supercops closed down the vac-trains.

The second alley leading off from the main street contained what he wanted. The Black Bull, a small, cheap pub, filled with hard-drinking men. He moved among them, unseen as his expanded senses examined their clothing and

skulls. None of them were fitted with neural nanonics, but several were carrying processor blocks.

He followed one into the toilets, where the only electrical circuit was for the light panel.

Jack McGovern was peeing blissfully into the cracked urinal when an icy hand clamped round the back of his neck and slammed his face into the wall. His nose broke from the impact, sending a torrent of blood to splash into the porcelain.

“You will take your processor block from your coat pocket,” a voice said. “Use your activation code, and make a call for me. Do it now, or die, dickhead.”

Rat-arsed he might have been, but overdosing on self-preservation allowed Jack’s mind to focus with remarkable clarity on his options. “Okay,” he mumbled, a lip movement which sent more blood dribbling down the wall. He fumbled for his processor block. There was an emergency police-hail program which was activated by feeding in the wrong code.

The terrible pressure on his neck eased off, allowing him to turn. When he saw who his assailant was, the thought of deviously calling for help withered faster than hell’s solitary snowflake.

Quinn returned to Kings Cross, sharing a lift down to the underground chamber with a cluster of vigilantes. He wandered through the vaulting hall, ambling round the closed kiosks and steering clear of industrious cleaning mechanoids. The lifts kept on disgorging gang members, who immediately took the wave escalators down to the platforms. He kept watching the informationals, paying particular attention to the arrivals screens. In the two hours which followed, five vac-trains arrived from Edmonton. All departures slowed down to zero.

The Frankfurt train pulled in at five minutes past five. Quinn went and stood at the top of its platform’s wave esca-

lator. They were the last to come up, Courtney and Billy-Joe gently guiding the drugged woman between them. The two acolytes had smartened up, looking closer to a pair of grungy university students than downtown barbarians now. Their snatch victim—a middle-aged woman wearing a crumpled dress with an unbuttoned cardigan—had the vacant eyes typical of a triathozine dose; her body fully functional, brain in an advanced hypnoreception state. There and them, if she'd been told to jump off the top of an arcology dome, she'd do it.

They moved at a brisk pace across the floor and hopped into a lift. Quinn wanted to materialize, just so he could cheer at the top of his voice. The tide was turning now. God's Brother had given His chosen messiah another sign that he remained on the path.

At five-thirty, the sixth train from Edmonton arrived. A notice slithered over the holograms announcing that the routes to North America had now been shut by order of Gov-central. Five minutes later, all departures were cancelled. Vac-trains already en route to the arcology were being diverted to Birmingham and Glasgow. London was now physically isolated from the rest of the planet.

It was just a little scary how his prediction had come so true. But then he was bound to be right, with God's Brother gifting him understanding.

People were coming up from the platforms: the last straggle of passengers, the vigilante gangs (already eyeing each other now the reason for their truce was over), the police duty teams, station crews. Informationals floating overhead vanished like pricked bubbles. Display boards blanked out. The twenty-four hour stalls closed up, their staff gossiping hotly together as they rode the lifts up to the surface. The wave escalators halted. All the solaris lights overhead dimmed down, sinking the cavern into a gloomy dusk. Even

the conditioning fans slowed, their whine dropping several octaves.

It was the paranoiac moment every solipsist fears. The world was a stage constructed around him, and this chunk of it was shutting down as it was no longer part of the act. For a second, Quinn worried that if he went to the dome wall and looked out there would be nothing there to see.

“Not yet,” he said. “Soon though.”

He took a last look round, then went over to one of the emergency fire stairs and started the long trek to the surface and the rendezvous point.

Louise was surprised at how much she associated the hotel room with *home*. But it was reassuring to be back after the ordeal of Edmonton. Partly it was because she now considered her obligation over: she'd done what she promised dear Fletcher and warned Banneth. A small blow struck against that monster Dexter (even though he'd never know). The fact that the Ritz was so comfortable helped a lot, too.

After Ivanov Robson dropped them off, both girls slept well into the morning. When they finally went downstairs for breakfast, reception informed Louise there was a small package for her. It was a single dark-red rose in a white box, with a silver bow tied round. The card that came with it was signed from Andy Behoo.

“Let me see,” Gen said, bouncing on her bed in excitement.

Louise smelt the rose, which to be honest was rather a weak scent. “No,” she said, and held the card aloft. “It’s private. You can put this in water, though.”

Gen regarded the rose suspiciously, sniffing it cautiously. “Okay. But at least tell me what he says.”

“Just: thank you for last night. That’s all.” She didn’t mention the second half of the message, where he said how lovely she was, and how he’d do anything to see her again.

The card was put into her new snakeskin bag, and the little pocket codelocked against small prying fingers.

Gen took one of the vases from the ancient oak dresser, and went off to the bathroom for some water. Louise datavisited her net connection server and inquired if there were any messages for her. The six-hourly ritual. Pointless, as the server would automatically deliver any communiqué as soon as it received one.

There were no messages. Specifically, no messages from Tranquillity. Louise flopped back on the bed, staring at the ceiling as she tried to puzzle it out. She knew she'd got the message protocol right; that was part of the NAS2600 communication program. Something had to be wrong at the other end. But when she put the news hound into primary mode, there was no report of anything untoward happening to Tranquillity. Perhaps Joshua simply wasn't there, and her messages were piling up in his net server memory.

She thought about it for a while, then composed a brief message to Ione Saldana herself. Joshua said he knew her, they'd grown up together. If anybody knew where he was, she would.

After that, she launched a quick directory search and datavisited detective Brent Roi.

"Kavanagh?" he replied. "God, you mean you bought yourself a set of neural nanonics?"

"Yes, you didn't say I couldn't."

"No, but I thought your planet didn't allow you that kind of technology."

"I'm not on Norfolk now."

"Yeah, right. So what the hell do you want?" he asked.

"I'd like to go to Tranquillity, please. I don't know who I have to get permission from."

"From me, I'm your case officer. And you can't."

"Why not? I thought you wanted us to leave Earth. If we

got to Tranquillity, you wouldn't have to worry about us any more."

"Frankly, I don't worry about you now, Miss Kavanagh. You seem to be behaving yourself—at least, you haven't tripped any of our monitor programs."

Louise wondered if he knew about the bugs Andy had removed at Jude's Eworld. She wasn't going to volunteer the information. "So why can't I go?"

"I gather you haven't got the hang of your news hound program yet."

"I have."

"Really. Then you ought know that as of oh-five-seventeen hours GMT, the global vac-train network was shut down by an emergency Presidential executive decree. Every arcology is on its own. The President's office says they want to prevent the possessed in Paris and Edmonton from sneaking into more arcologies. Myself, I think it's a load of crap, but the President is scared of public opinion more than he is of the possessed. So like I told you before, you're on Earth for the duration."

"Already?" she whispered aloud. So much for Govcentral moving slowly. But Robson had been right again. "There must be a way out of London to the tower," she datavised.

"Only the vac-trains."

"But how long will this go on for?"

"Ask the President. He forgot to tell me."

"I see. Well, thank you."

"Don't mention it. You want some advice? You have finite funds, right? You might consider shunting along to a different hotel. And if this goes on for much longer, which I suspect it will, you'll need a job."

"A job?"

"Yeah, that's one of those nasty little things ordinary people do, and in return they get given money by their employer."

“There’s no need to be rude.”

“Eat it. When you apply to the local Burrow Burger as a waitress, or whatever, they’ll want your citizenship number. Refer them to me, I’ll grant you temporary immigrant status.”

“Thank you.” That much sarcasm couldn’t be carried along a datavise, but he’d know.

“Hey, if you don’t fancy that, at least you’ve got an alternative. A girl like you won’t have any trouble finding a man to look after her.”

“Detective Roi, can I ask what happened to Fletcher?”

“No, you can’t.” The link ended.

Louise looked out of the window across Green Park. Dark clouds swirled over the dome, hiding the sun. She wondered who’d sent them.

It was a forty-storey octagonal tower in the Dalston district, one of eight similar structures that made up the Parsonage Heights development. They were supposed to raise the general tone of the neighbourhood, encumbered as it was by low-cost housing, bargain centre market halls, and a benefits-reliant population. The towers were supposed to rest on a huge underground warren of factory and light manufacturing units. Above that buzzing industrial core, the first seven floors would be given over to retail outlets, followed by five floors of leisure industry premises, three more floors of professional and commercial offices, and the remaining floors taken up by residential apartments. The whole entity would be an economic heart transplant for Dalston, creating opportunity and invigorating the maze of shabby ancient streets outside with rivers of commerce and new money.

But Dalston’s underlying clay had a water-table problem which would have tripled the cost of the underground factory warren in order to prevent it from flooding, so it was downgraded to a couple of levels of storage warehousing.

The local market halls cut their rock bottom prices still further, leaving half of the retail units unrented; franchise chains took over a meagre eight per cent of the designated leisure floorspace. In order to recoup their investment, Voynow Finance hurriedly converted the thirty upper floors into comfortable apartments with a reasonable view across the Westminster Dome, which market research indicated they could sell to junior and middle management executive types.

The rushed compromise worked, after a fashion. Certainly, sixty years after its construction, Parsonage Heights was home to a slightly more affluent class than Dalston's average. There were even some reasonable shops and cafés established on the lower floors—though what activities went on in the dilapidated, damp, and crumbling warehouses hidden beneath was something the top-floor residents declined to investigate.

The local police station knew there was a Light Bringer coven down there; but for whatever reason, the chief constable had never instituted a raid. So when Banneth's tube train pulled in at Dalston Kingsland station, the magus and a fifteen-strong bodyguard was waiting with impunity on the platform to greet her. She took one look at the blank-faced young toughs carrying their pathetic assortment of inferior weapons, and had trouble preventing a laugh.

Did you arrange this? she asked Western Europe.

I simply told the magus how important you are to God's Brother. He reacted appropriately, don't you think?

Too appropriately. This is becoming a farce.

The Dalston coven magus stepped forwards, and bowed slightly. "High Magus, it's an honour to have you here. We have your safe house ready."

"It better be a good one, or I'll have you strapped down

on your own altar and demonstrate how we deal with people who fail God's Brother in Edmonton."

The magus's vaguely hopeful air wafted away, leaving behind a belligerent expression. "You won't be able to fault us. *Our* position hasn't been compromised."

She ignored the crude reference. "Lead on."

The bodyguard clumped their way noisily up the carbon-concrete stairs and out onto Kingston High Street. The first four out of the station's automatic door levelled their TIP carbines along the road, which startled the few late-night pedestrians heading home from the district's grotty clubs. They swept their muzzles round in what they thought was a professional scanning manoeuvre.

"Clear!" the leader barked.

Banneth rolled her eyes as the rest of the bodyguard hurried out around her. Cars had been halted in the street to let them cross. They hurried into the ground floor mall of the Parsonage Heights tower opposite the station. Three more sect members were waiting inside, standing guard beside an open lift. The magus and eight bodyguards crowded in around Banneth. They rode it to the top floor, where it opened out directly into the penthouse vestibule. More sect members were inside, toting their weapons and finishing off the new security sensor array.

"No fucker's going to sneak up on you while you're here," the magus said confidently. "We've got every approach covered. There'll be guards outside, and in all the stairwells. Nobody gets in or out without a secure access code, which you have command authority over."

Banneth walked into the penthouse, which occupied the whole fortieth floor. The absent owner had chosen its decor straight out of a thirty-year-old catalogue file specialising in unashamed chintz: green leather furniture, Turkish rugs over polished marble tiles, glowing primary-colour sketches hanging on the walls, and a red marble fireplace complete

with holographic flames. A glass wall had swing-up slab doors which led out to a roof garden with a swimming pool and hot tub; the sun loungers were sculpted blue plastic frogs.

“The fridge is full,” the magus said. “If you take a fancy to anything, just let us know and we’ll have it sent up. I can get anything you need. My grip on this town is total.”

“I’m sure,” Banneth said. “You, you, and you,” her finger singled out two attractive girls and a teenage boy. “Stay. The rest of you, fuck off. Now.”

The magus blushed heavily. Treating him like a piece of street shit in front of his acolytes would be a serious blow to his authority. She stared right at him, a silent direct challenge.

He snapped his fingers, gesturing everyone out, then stomped through the big blackwood doors without looking back.

“Dump the guns,” Banneth told the three remaining acolytes. “You won’t be needing them in here.”

After a moment’s hesitation they left them beside the kitchen bar. Banneth walked out into the small paved garden. Night fuchsias spilled their sweetness into the air. It had a balcony of high, one-way glass, allowing her to look over the glimmering crater of lights which defined the city. Nobody could see in. A reasonable protection against snipers, she acknowledged.

Did I cause a big enough splash? she asked Western Europe.

Oh yes. The dear magus is currently screaming at London’s High Magus about how big a shit you are. All the covens will be talking about your arrival by this evening.

Evening. She shook her head irritably. **I hate train lag.**

Not relevant. I’ll have the little traffic-stopping scene downstairs logged on the police intelligence bulletin

as well. The patrol constables will ask their informants for further information about the coven's new activities. We'll have the whole arcology covered. Dexter will find you.

"Shit," Banneth mumbled. She beckoned the nervous acolytes out onto the roof garden. "One, find me a decent glass of Crown whisky; then take your clothes off. I want to watch you swimming."

"Um, High Magus," one of the girls said anxiously. "I can't swim."

"Then you'd better learn fast. Hadn't you?"

Banneth ignored their whispering behind her, and looked upwards. Long strips of faintly luminescent cloud curved round the dome, breaking into agitated foam as they hit the surface flow boundary. Patches of night sky were visible through the choppy fringes. Stars and spacecraft shone bright against the blackness. There was the hint of a hazy ark above the northern horizon.

This penthouse is difficult to reach from the ground, but wide open to the sky, she observed. That means an SD strike.

Correct. I have no intention of using a nuke inside the dome. But an X-ray laser can penetrate the crystal with minimal damage. If he can survive that, then frankly there is no hope for us.

There certainly isn't for me.

You created him.

B7 created me.

We permitted you, there's a difference. You were convenient for us. Under our patronage you fulfilled most of your ambitions. Without us, you would now either be dead or an Ivet.

If I can take him out . . .

No. I don't want you fighting back. He must not be made to turn invisible again. I only have one chance at

this. It's quite poetic really: the whole world's future depending on an individual.

Poetic. Fuck, what the hell are you people?

I believe our original agreement was that B7's patronage would be provided on a no-questions-asked basis. Despite your predicament, you still don't qualify to ask that question, and I have no intention of indulging you. When you are dead, then you can observe me from the beyond.

Some people make it past the beyond. That's what the Edenists claim.

Then I wish you bon voyage.

Banneth glanced out over the preserved city again. The first pale grey photons of dawn were slipping up from the eastern horizon to lap against the bottom of the giant crystal dome. She wondered how many more dawns she was going to see.

Truthful estimate, knowing the way she'd put Dexter together, no more than a week.

The acolytes were splashing about in the pool now, including the non-swimming girl clinging resolutely to the shallow end. Banneth didn't care, the whole point was just to see their great young bodies glistening wet. Indulging herself with them was definitely one-up on the customary last meal. However, there were files stored in her neural nanonics which had to be edited and prepared. Her lifetime's work. She could hardly allow it to go to waste, though finding an institution that would accept it might prove difficult. It wasn't just that she wanted it preserved, she wanted it studied, utilized. An important body of knowledge: human behaviour under the kind of extreme conditions that would forever remain closed to academic medical circles. It was unique, which made it all the more valuable. Perhaps some day it might become a classic reference for psychology students.

She went back into the lounge and settled into one of the dreadful green leather couches, ready to start indexing the files. It would be amusing to see how long the acolytes stayed in the water.

The Lancini had been built at the start of the Twenty-first Century, a huge department store intended to rival London's best: set on Millbank overlooking the Thames, it had a *très chic* view which along with its retro-thirties decor was calculated to bring in the affluent and curious alike. As with all outsize endeavours, its decline was never going to be swift. It had limped along for decades with falling customer numbers and negative profits. The image it attempted to foster right from the start was dignity without snobbishness. According to the market survey programs worshiped by its executives, such a policy would attract older shoppers, with their correspondingly larger credit funds. Floor managers, left with no margin for innovation, kept ordering established, unhip, brands to serve their loyal, ageing shoppers. Every year, fewer of them returned.

The execs really should have known that; if they'd just cross-linked their market surveys with the store's own funeral service department, they would have seen just how far their customer loyalty extended. Unfortunately, it didn't quite extend to after-burial purchasing. So 2589 saw the very last traditional January sale ending with an undignified auction to dispose of the store's fittings. Now only the shell of the building remained.

Nothing changed, because nothing was allowed to change. The London historical buildings continuity council made quite sure of that in its rigorous defence of heritage. Anyone was free to purchase the Lancini and start a commercial business up in it, providing it was refurbished to match the original interior plans, and that business was retail

shopping. Another setback to refurbishment was the price the receivers were demanding to satisfy the store's creditors.

Then news of possession and the beyond reached Earth. And, quite paradoxically, age suddenly became a highly motivating factor in change. It was old people who sat on the historical buildings continuity council. London's most venerated (and richest) banks and financial institutions were mostly governed by centenarians. These were the people who were going to be the first generation of humans who would enter the horror of the beyond knowing it was waiting for them. Unless, of course, a method of salvation was found. So far the Church (any/every denomination), Gov-central's science councils, and the Confederation Navy had been unable to provide that salvation.

That just left one possible refuge: zero-tau.

Several companies were quickly formed to supply demand. Obviously, long-term facilities would ultimately be needed to carry these customers of oblivion through the millennia; mausolea more enduring than the pyramids. But they'd take time to design and build; meanwhile the hospital chaplains remained in business. Temporary storage facilities were urgently required.

By a near unanimous vote, the historical buildings continuity council quickly approved a change of use of premises certificate for the Lancini. Zero-tau pods were shipped in from the Halo and taken in via delivery gates more used to household furnishings and haute couture. The ancient cage lifts had the load capacity to take them up to every floor. Oak floorboards, seasoned by five centuries of dehumidified conditioning, were strong enough to hold the new weight distribution pattern. Heavy-duty cabling laid in for the floor displays carried sufficient electricity to feed the pods' power-hungry systems. In fact, if it hadn't been for the building's projected three hundred year lifespan, the Lancini would have made a good eternity crypt.

Certainly Paul Jerrold thought it appropriate enough when he was shown to his pod. It was on the fourth floor, one of a long row in the old Horticultural section, lined up opposite the windows. Over half of the big sarcophagi were active, their black surfaces absorbing the dust-choked sunbeams as if they were spatial chasms. The two nurses helped him in over the rim, then fussed round, smoothing down his loose fitting track-suit. He kept quiet through the nannying; at a hundred and twelve he was becoming used to the attitude of medical staff. Always exaggerating the attention they gave their patients, as if the care would go unnoticed if they didn't.

"Are you ready?" one asked.

Paul smiled. "Oh yes." The last couple of weeks had been busy ones, itself a blessing at his age. First the devastating news of possession. Then the slow response, the determination by himself and the others at his elite West End club that they should not become victims of the beyond. The web of discreet contacts put out, offering an alternative for those who could pay for it. His solicitors and accountants had been tasked with shifting his substantial holdings into a long-term trust that would pay for maintaining his stasis. It didn't cost much: maintenance, rent, and power. Even if the trust was badly bungled, he had enough money in the bank to keep himself secure for ten thousand years. Then once it had been arranged, there had been the arguments with his children and their swarm of offspring, all of whom had adopted a quiet waiting policy to obtain his wealth. A brief legal battle (he could afford much better lawyers than they), and that was it, and here he was: a new breed of chrononaut.

His habitual dread of the future had faded, replaced by a keen interest in what awaited. When the zero-tau field switched off, there would be a full solution to the beyond, society would have evolved radically to take knowledge of the afterlife into account. There might even be a decent re-

juvenation treatment available. Possibly, humans would have finally achieved physical immortality. He would become as a god.

A flicker of greyness, shorter than an eyeblink . . .

The pod cover lifted, and Paul Jerrold was slightly surprised to see he was still in the Lancini. He'd expected to be in some huge technological vault, or perhaps a tasteful recovery room. Not right back where his voyage through eternity had started. Unless these new, magnificently advanced humans had re-created the Lancini to provide their ancestors with the psychological comfort of familiar territory, a considerate way to ease their introduction to this fabulous new civilization built in his absence.

He glanced eagerly through the big, dirty window opposite. Dusk had fallen across the Westminster Dome. The thriving lights of the south bank glimmered brightly in front of the steel grey clouds smothering the vast arc of the dome. A projection of some kind?

The pair of medical staff attending him were somewhat unconventional. A girl leaned over the pod, very young, with amazingly large breasts squeezed up by a tight leather waistcoat. The adolescent boy standing beside her wore an expensive pure-wool sweater that was somehow wrong on him; his face was stubbly, with animal-mad eyes. He held a loop of power cable in one hand, plug dangling loosely.

Paul took one look at the plug, and datavised an emergency code. He couldn't get a response from any net processor; then his neural nanonics crashed. A third figure clad in a jet-black robe slipped out of the gloom to stand at the foot of the pod.

"Who are you?" Paul croaked in fright. He levered himself up into a sitting position, skinny hands with their bulging veins gripping the edge of the pod.

"You know exactly who we are," Quinn said.

"Have you won? Did you defeat us?"

“We’re going to, yes.”

“Oww shit, Quinn,” Billy-Joe protested. “Look at these old farts, they ain’t good for nothing. No soul’s gonna make them last, not even with your kind of black magic.”

“They’ll last long enough. That’s all that matters.”

“I told you, you want decent possessed you gotta go to the sects for bodies. Fuck, they worship you. All you’ve gotta do it tell them to bend over, they ain’t gonna put up no fight.”

“God’s Brother,” Quinn growled. “Don’t you ever think, shithead? The sects are a lie. I’ve told you, they’re controlled by the supercops. I can’t go to them for anything, we’d just give ourselves away. This place is fucking perfect. Nobody’s going to notice people going missing from here, as far as this world’s concerned they stopped existing as soon as they walked through the door.” His face jutted out of the hood to grin down at Paul. “Right?”

“I have money.” It was Paul’s last gambit, the one thing everyone desired.

“That’s good,” Quinn said. “You’re almost one of us already. You don’t have far to go.” He pointed a finger, and Paul’s world howled into pain.

Western Europe had hooked eight AIs in to London’s communication net, which gave him enough processing capacity to review each chunk of electronic circuitry in the arcology on a ten second cycle, providing it had a net connection. All processor blocks, no matter what their function, were datavised on a fifteen-second rota and examined for suspect glitches.

He wasn’t the only worried citizen. Several commercial software houses had gripped the marketing opportunity and offered possession monitoring packages. It consisted of a neural nanonics program which sent a continual capacity diagnostic and location datavise to the company security cen-

tre, who would alert the police if the user suffered an unexplained glitch or drop out. Bracelets were also spilling into the shops which did the same thing for kids too young for neural nanonics.

Communication bandwidth was becoming a serious problem. Western Europe had used GSDI authority to prioritize the AI scanning programs, leaving them unimpeded while civil data traffic suffered unheard of capacity reductions and switching delays.

The visualization of the arcology's electronic structure was a theatrical gesture, impressing no one. It stood on the table of the sensenviron secure conference chamber like an elaborate glass model of the ten domes. Fans of coloured light rotated through the miniature translucent structures with strobe-like repetition.

South Pacific studied their movement as the other B7 supervisor representations came on line around the oval table. When all sixteen were there, she asked: "So where is he, then?"

"Not in Edmonton," North America said. "We kicked their asses out of the universe. The whole goddamn nest of them. There's none of the bastards left."

"Really?" Asian Pacific said. "So you've accounted for the friend of Carter McBride as well, have you?"

"He's not a threat to the arcology, he only wants Dexter."

"Crap. You can't find him, and he's just an ordinary possessed." Asian Pacific waved an arm at the simulacrum of London. "All they have to do is steer clear of electronics, and they're safe."

"Got to eat sometime," Southern Africa said. "It's not like they've got friends to take care of them."

"The Light Bringer sect loves them," East Asia grumbled.

"The sects are ours," Western Europe said. "We have no worries in that direction."

"Okay," South Pacific said. "So tell us how you're doing

in New York? We all thought the police had got them that time as well.”

“Ah yes,” Military Intelligence said. “What’s the phrase the news anchors keep using? Hydra Syndrome. Shove one possessed into zero-tau, and while you’re doing that five more come forth. Emotive figures, but true.”

“New York got out of hand,” North America said. “I wasn’t prepared for that.”

“Obviously. How many domes have been taken over now?”

“Figures of that magnitude are unnecessarily emotive,” Western Europe said. “Once the possessed base population climbs above two thousand, there’s nothing anyone can do. The exponential curve takes over and the arcology is lost. New York is going to be this planet’s Mortonridge. It’s not our concern.”

“Not our concern!” North Pacific said. “This is bullshit. Of course it’s our concern. If they spread through the arcologies this whole planet will be lost.”

“Large numbers are not our concern. The military will have to deal with New York later.”

“If it’s still here, and if they don’t turn cannibal. The food vats won’t work around possessed, you know, and the weather shields won’t hold, either.”

“They’re reinforcing the domes they’ve captured with their energistic power,” North America said. “The arcology caught the tail end of an armada storm last night. The domes all held.”

“Only until they complete their takeover,” South Pacific said. “The remaining domes can’t barricade themselves in forever.”

“New York’s inevitable fall is regrettable, I’m sure,” Western Europe said. “But not relevant. We have to accept it as a defeat and move forward. B7 is about prevention, not

cure. And in order to prevent Earth itself from falling, we have to eliminate Quinn Dexter.”

“So like I asked, where is he?”

“Undetermined at this moment.”

“You lost him, didn’t you? You blew it. He was a sitting duck in Edmonton, but you thought you were smarter. You thought your dandy little psychology game would triumph. Your arrogance could have enslaved us all.”

“Interesting tense, there,” Western Europe snapped. “Could have. You mean, until you saved the day by closing down the vac-trains, after we agreed not to screw each other over.”

“The President had a very strong public mandate for closing them down. After Edmonton’s High Noon firefight, the whole world was clamouring for a shutdown.”

“Led by your news companies,” Southern Africa said.

Western Europe leaned over the table towards a smiling South Pacific, his head centimetres short of the simulacrum. “I got them back, you moronic bitch. Banneth and Louise Kavanagh returned to London safely. Dexter will do everything in his power to follow them there. But he can’t bloody well do that if he’s trapped in Edmonton. Six trains, that’s all that got out before your stupid shut down order. Six! It’s not enough to be certain.”

“If he’s as good as you seem to think, he would have got on one of them.”

“You’d better hope he has, because if he was left behind you can kiss goodbye to Edmonton. We have nothing in place there which could confirm his existence.”

“So we lose two arcologies. The rest are now guaranteed safe.”

“I lose two arcologies,” North America said. “Thanks to you. Do you realize how much territory that is for me?”

“Paris,” South Pacific said. “Bombay, Johannesburg. Everyone’s taking losses today.”

"You're not. And the possessed are on the run in those arcologies. We have them locked down, thanks to the sects. None of those will escalate into a repetition of New York."

"We hope," said India. "I'm managing parity at the moment, that's all. But panic is going to be a factor in the very near future. And that works to their advantage."

"You're quibbling over details," South Pacific said. "The point is, there are methods of solving this problem other than obsessing over Dexter. My policy is the correct one. Confine them while we engineer a permanent solution. If that had been adopted at the start, we would have lost the Brazilian tower ground station at most."

"We didn't know what we were dealing with when Dexter arrived," South America said. "We were always going to lose one arcology to him."

"Dear me, I had no idea this was a policy forum," Western Europe said. "I thought we were conducting a progress review."

"Well, as you've made no progress . . ." South Pacific said sweetly.

"If he's in London, he won't be found by conventional means. I thought we'd established that. And for your information, total inactivity isn't a policy, it's just the wishful thinking of small minds."

"I've stopped the spread of possession. Remind us what you've achieved?"

"You're fiddling while Rome burns. The cause of the fire is our paramount concern."

"Eliminating Dexter will not remove the possessed in New York or anywhere else. I vote we devote a higher percentage of our scientific resources to finding a permanent solution."

"I find it hard to credit that even you are playing politics with this. Percentages aren't going to make the slightest difference to the beyond at this stage. Anyone who can provide

a relevant input to the problem had been doing just that since the very beginning. We don't need to call in the auditors to verify our compassion credentials, they're hardly quantifiable in any case."

"If you don't want to be a part of the project, fine. Be sure you don't endanger us any further by your irresponsibility."

Western Europe cancelled his representation, withdrawing from the conference. The simulacrum of London vanished with him.

The cave was at the lowest level of the endcap caverns, protected on all sides by hundreds of metres of solid polyp. Tolton felt quite secure inside it; first time in a long time.

Originally a servitor veterinary centre, it had been pressed into use as a physics lab. Dr Patan headed up the team which the Valisk personality had charged with making sense of the dark continuum. He'd greeted Dariat's arrival with the joy of a long-lost son. There had been dozens of experiments, starting with simple measurements: temperature (Dariat's ersatz body was eight degrees warmer than liquid nitrogen, and almost perfectly heat resistant) electrical resistivity (abandoned quickly when Dariat protested at the pain). Then came energy spectrum and quantum signature analysis. The most interesting part for a layman observer like Tolton was when Dariat gave a sample of himself. Patan's team quickly decided an in-depth study was impossible when the fluid was being animated by Dariat's thoughts. Attempts to stick a needle into him and draw some away proved impossible, the tip wouldn't penetrate his skin. In the end it was down to Dariat himself, holding his hand over a glass dish and pricking himself with a pin which he'd conjured into existence by imagination. Red blood dripped out, changing as it fell away from him. Slightly sticky grey-white fluid splattered into the bowl. It was carried away triumphantly by the physicists.

Dariat and Tolton exchanged a bemused look, and went to sit at the back of the lab.

“Wouldn’t it have been easier to tear off a bit of cloth from your toga?” Tolton asked. “I mean, it’s all the same stuff, right?”

Dariat gave him a flabbergasted look. “Bugger. I never thought of that.”

They spent the next couple of hours talking quietly, with Dariat filling in the details of his ordeal. The conversation stopped a couple of hours later when he fell silent, and gave the physicists a cheerless glance. They’d been quiet for several minutes, five of them and Erentz studying the results of a gamma spike microscope. Their expressions were even more worried than Dariat’s.

“What have you found?” Tolton asked.

“Dariat might be right,” Erentz said. “Entropy here in the dark continuum appears to be stronger than in our universe.”

“For once I wish I hadn’t said I told you so,” Dariat said.

“How do you know?” Tolton asked.

“We have contended this state for some time,” Dr Patan said. “This substance seems to confirm that. Although I can’t give you an absolute yet.”

“What the hell is it, then?”

“Best description?” Dr Patan smiled thinly. “It’s nothing.”

“Nothing? But he’s solid.”

“Yes. The fluid is a perfect neutral substance, the end product of total decay. That’s the best definition I can give you based on our results. A gamma spike microscope allows us to probe sub-atomic particles. A most useful device for us physicists. Unfortunately, this fluid has no sub-atomic particles. There are no atoms as such; it appears to be made up from a single particle, one with a neutral charge.”

Tolton summoned up his first grade physics didactic memories. “You mean neutrons?”

“No. This particle’s rest mass is much lower than that. It

has a small attractive force, which gives it its fluidic structure. But that's its only quantifiable property. I doubt it would ever form a solid, not even if you were to assemble a supergiant star mass of the stuff. In our own universe, that much cold matter will collapse under its own gravity to form neutronium. Here, we believe there's another stage of decay before that happens. Energy is constantly evaporating out of electrons and protons, breaking down their elementary particle cohesion. In the dark continuum dissipation rather than contraction would appear to be the norm."

"Is evaporating? You mean we're leaking energy out of our atoms right now?"

"Yes. It would certainly explain why our electronic systems are suffering so much degradation."

"How long till we dissolve into that stuff?" Tolton yelled.

"We haven't determined that yet. Now we know what we're looking for, we will begin calibrating the loss rate."

"Oh shit." He whirled round to face Dariat. "The lobster pot, that's what you called this place. We're not going to get out, are we."

"With a little help from the Confederation, we can still make it back, atoms intact."

Tolton's mind was racing ahead with the concept now. "If I just fall apart into that fluid, my soul will be able to pull it back together. I'll be like you."

"If your soul contains enough life-energy, yes."

"But that fades away as well. . . . Yours does, you had to steal more from that ghost. And those entities outside, they're all battling for life-energy. That's all they do. Ever."

Dariat smiled with sad sympathy. "That's the way it goes here." He broke off and stared at a high corner of the cave. The physicists did the same, their expressions all showing concern.

"Now what?" Tolton demanded. He couldn't see anything up there.

“Looks like our visitors have got tired with the southern endcap,” Dariat told him. “They’re coming here.”

The first of three Confederation Navy Marine flyers soared across Regina just as twilight fell. Sitting in the mid-fuselage passenger lounge, Samuel Aleksandrovich accessed the craft’s sensor suite to see the city below. Street lighting, adverts, and skyscrapers were responding to the vanishing sun by throwing their own iridescent corona across the urban landscape. He’d seen the sight many times before, but tonight the traffic along the freeways was thinner than usual.

It corresponded to the mood reported by the few news shows he’d grazed over the last couple of days. The Organization’s attack had left the population badly shaken. Of all the Confederation worlds, they had supposed Avon to be second only to Earth in terms of safety. But now Earth’s arcologies had been infested, and Trafalgar was so badly damaged it was being evacuated. There wasn’t a countryside hotel room to be had anywhere on the planet as people claimed their outstanding vacation days or called in sick.

The flyer shot over the lake bordering the eastern side of the city and swiftly curved back, losing height as it approached the Navy barracks in the shadow of the Assembly Building. It touched down on a circular metal pad, which immediately sank down into the underground hangar. Blast-proof doors rumbled shut above it.

Jeeta Anwar was waiting to greet the First Admiral as he emerged from the flyer. He exchanged a couple of perfunctory words with her, then beckoned the captain of the Marine guard detail.

“Aren’t you supposed to check new arrivals, Captain?” he asked.

The captain’s face remained blank, though he was strangely incapable of focusing on the First Admiral. “Yes, sir.”

“Then kindly do so. There are to be no exceptions. Understood?” A sensor was applied to the First Admiral’s bare hand; he was also asked to datavise his physiological file into a block.

“Clear, sir,” the captain reported, and snapped a salute.

“Good. Admirals Kolhammer and Lalwani will be arriving shortly. Pass the word.”

The Marine guard squad emerging from the flyer, and the two staff officers, Amr al-Sahhaf and Keaton, were also quickly vetted for signs of possession. Once they were cleared, they fell in around the First Admiral.

The incident put Samuel Aleksandrovich in a bad frame of mind. On the one hand the captain’s behaviour was excusable; that the First Admiral would be a possessed infiltrator was inconceivable. Yet possession was still spreading precisely because no one believed their friend/spouse/child could have been taken over. That was why the Navy was leading by example, the three most senior admirals all taking different flyers to the same destination in case one of them was targeted by a rogue weapon. Enforced routine procedures might just succeed where personal familiarity invited disaster.

He met President Haaker in the barracks commander’s conference room. This was one discussion both of them had agreed shouldn’t be taken to the Polity Council just yet.

The President had Mae Ortlieb with him, which gave them two aides each. All very balanced and neutral, Samuel thought as he shook hands with the President. Judging by Haaker’s unconstrained welcome, he must have thought the same.

“So the anti-memory does actually work,” Haaker said as they sat round the table.

“Yes and no, sir,” Captain Keaton said. “It eradicated Jacqueline Couteur and her host along with Dr Gilmore.

However, it didn't propagate through the beyond. The souls are still there."

"Can it be made to work?"

"The principal is sound. How long it will take, I don't know. Estimates from the development team range from a couple of days to years."

"You are still giving it priority, aren't you?" Jeeta Anwar asked.

"Work will be resumed as soon as our research team is established in its back-up facility," Captain Amr al-Sahhaf said. "We're hoping that will be inside a week."

Mae turned to the President. "One team," she said pointedly.

"That doesn't seem to be much of a priority," the President said. "And Dr Gilmore is dead. I understand he was providing a lot of input."

"He was," the First Admiral said. "But he's hardly irreplaceable. The basic concept of anti-memory has been established; developing it furthers a multidisciplinary operation."

"Exactly," Mae said. "Once a concept has been proved, the quickest way to develop it is give the results to several teams; the more people, the more fresh ideas focused on this, the faster we will have a useable weapon."

"You'd have to assemble the teams, then bring them up to date on our results," Captain Keaton said. "By the time you've done that, we will have moved on."

"You hope," she retorted.

"Do you have some reason to think the Navy researchers are incompetent?"

"None at all. I'm simply pointing out a method which insures our chances of success are significantly multiplied. A standard approach to R&D, in fact."

"Who would you suggest assists us? I doubt astroengi-

neering company weapons divisions have the necessary specialists.”

“The larger industrialized star systems would be able to assemble the requisite professionals. Kulu, New Washington, Oshanko, Nanjing, Petersburg, for starters, and I’m sure the Edenists would be able to provide considerable assistance; they know more about thought routines than any Adamist culture. Earth’s GISD has already offered to help.”

“I’ll bet they have,” Samual Aleksandrovich grunted. By virtue of his position he had an idea of just how widespread Earth’s security agency was across the Confederation stars. They had at least three times the assets of the ESA, though even Lalwani was uncertain just how far their networks actually reached. One of the reasons it was so difficult to discover their size was the network’s essentially passive nature. In the last ten years there had only been three active operations that CNIS had discovered, and all of those were mounted against black syndicates. Quite what they did with all the information their operatives gathered was a mystery, which made him cautious about trusting them. But they always cooperated with Lalwani’s official requests for information.

“It’s a reasonable suggestion,” the President said.

“It would also remove exclusivity from the Polity Council,” the First Admiral said. “If sovereign states acquire a viable anti-memory weapon they could well use it without consultation, especially if one of them was facing an incursion. After all, that kind of supra-racial genocide would not leave any bodies as evidence. Anti-memory is a doomsday weapon, our primary negotiating tactic. As I have always maintained, it is not a solution to this problem. We must face this collectively.”

The President gave a reluctant sigh. “Very well, Samual. Keep it confined to the Navy for now. But I shall review the situation in a fortnight. If your team isn’t making the kind of

progress we need, I'll act on Mae's suggestion and bring in outside help."

"Of course, Mr President."

"That's good then. Let's go face the Polity Council and hear the real bad news, shall we." Olton Haaker rose with a pleasant smile in place, content another problem had been smoothly dealt with in the traditional consensus compromise. Mae Ortlieb appeared equally sanguine. Her professional expression didn't fool Samuel Aleksandrovich for a second.

For its private sessions the Confederation's Polity Council eschewed secure sensenvirons, and met in person in a discrete annex of the Assembly building. Given that this was where the most crucial decisions affecting the human race would be taken, the designers had seen fit to spend a great deal of taxpayer's money on the interior. It was the amalgam of all government Cabinet rooms, infected with a quiet classicism. Twelve native granite pillars supported a domed roof painted in Renaissance style, with a gold and platinum chandelier hanging from the centre, while swan-white frescos of woodland mythology roamed across powder blue walls. The central round table was a single slice of ancient sequoia wood, taken from the last of the giant trees to fall before the Armada Storms. Its fifteen chairs were made from oak and leather to a Nineteenth-Century Plymouth design, and new (each delegate was allowed to take theirs home with them after their term was over). Glass-fronted marbled alcoves displayed exactly 862 sculptures and statuettes; one donated by each planet in the Confederation. The Tyrathca had contributed a crude hexagonal slab of slate with faint green scratches on the surface, a plaque of some kind from Tanjuntic-RI (worthless to them, but they knew how much humans valued antiquity). The Kiint had presented an enigmatic kinetic sculpture of silvery foil, composed of

twenty-five concentric circular strips that rotated around each other without any bearings between them, each strip was suspended in air and apparently powered by perpetual motion (it was suspected they were pieces of metallic hydrogen).

Lalwani and Kolhammer joined the First Admiral outside the council chamber, and the three of them followed the President in. Twelve chairs were already filled by the ambassadors currently appointed to the Polity Council. Haaker and Samuel took their places, leaving the fifteenth empty. Although Ambassador Roulor was entitled to take the seat vacated by Rittagu-FUH, the Assembly had delayed formally voting to confirm his appointment. The Kiint hadn't complained.

Samuel sat down with minimum fuss, acknowledging the other ambassadors. He didn't enjoy the irony of being called here in the same way he'd called them to request the starflight quarantine. It indicated events were now controlling him.

The President called the meeting to order. "Admiral, if you could brief us on the Trafalgar situation, please."

"The evacuation will be complete in another three days," Samuel told them. "Active Navy personnel were given priority and are being flown to their secondary locations. We should be back up to full operational capability in another two days. The civilian workers are being ferried down to Avon. All decisions about refurbishing the asteroid will be postponed until the crisis is over. We'll have to wait until it's physically cooled down anyway."

"What about the ships?" the President enquired. "How many were damaged?"

"One hundred and seventy three Adamist ships were destroyed, a further eighty-six are damaged beyond repair. Fifty-two voidhawks were killed. Human deaths so far stand at nine thousand two hundred and thirty-two. Seven hundred and

eighty-seven people have been hospitalised, most of them with radiation burns. We haven't released those figures to the media yet. They just know it's bad."

The ambassadors were silent for a long moment.

"How many starships belonged to the First Fleet?" Earth's ambassador asked.

"Ninety-seven front-line warships were lost."

"Dear God." Samual didn't see who muttered that.

"Capone cannot be allowed to get away with an atrocity of this magnitude," the President said. "He simply cannot."

"It was an unusual set of circumstances," Samual said. "Our new security procedures should prevent it happening again." Even as he spoke the words, he knew how pathetic it sounded.

"Those circumstances, possibly," Abeche's ambassador said bitterly. "What if he dreams up some new course of action? We'll be left with another bloody great disaster on our hands."

"We'll stop him."

"You should have expected this, made some provision. We know Capone had antimatter, and he has nothing to lose. That combination was bound to result in a reckless strike of some kind. Jesus Christ, don't your strategy planners consider these scenarios?"

"We're aware of them, Mr Ambassador. And we do take them seriously."

"Mortonridge hasn't delivered anything like the victory we were expecting," Miyag's ambassador said. "Capone's infiltration flights have got everybody petrified. Now this."

"We have eliminated Capone's source of antimatter," the First Admiral said levelly. "The infiltration flights have stopped because of that. He does not have the resources to conquer another planet. Capone is a public relations problem, not the true threat."

"Don't tell me we should just ignore him," Earth's am-

bassador said. "There's a difference between confining your enemy and not doing anything in the hope he'll go away, and the Navy has done precious little to convince me it's got Capone under control."

The President held a hand up to prevent the First Admiral from replying. "What we're saying, Samual, is that we have decided to change our current policy. We can no longer afford the holding tactics of the starflight quarantine."

Samual looked around the hard, determined faces. It was almost a vote of no confidence in his leadership. Not quite, though. It would take another setback before that happened. "What do you propose to replace it with?"

"An active policy," Abeche's ambassador said hotly. "Something that will show people we're using our military resources to protect them. Something positive."

"Trafalgar should not be used as a *casus belli*," the First Admiral insisted.

"It won't be," the President said. "I want the Navy to eliminate Capone's fleet. A tactical mission, not a war. Wipe him out, Samual. Eliminate the antimatter threat completely. As long as he still has some, he can send one Pryor after another sneaking through our defences."

"Capone's fleet is all that keeps him in charge of the Organization. If you take that away, we'll loose Arnstat and New California. The possessed will take them out of the universe."

"We know. That's the decision. We have to get rid of the possessed before we can start to deal with them properly."

"An attack on the scale necessary to destroy his fleet, and New California's SD network will also kill thousands of people. And I'd remind you that the majority of crews in the Organization ships are non-possessed."

"Traitors, you mean," Mendina's ambassador said.

"No," the First Admiral said steadily. "They are blackmail victims, working under the threat of torture to themselves

and their families. Capone is quite ruthless in his application of terror.”

“This is exactly the problem we must address head on,” the President said. “We are in a war situation. We must retaliate, and swiftly or we will lose what little initiative we have. Capone must be shown we are not paralysed by this diabolical hostage scenario. We can still implement our decisions with force and resolution when required.”

“Killing people will not help us.”

“On the contrary, First Admiral,” Miyag’s ambassador said. “Although we must deeply regret the sacrifice, eradicating the Organization will give us a much needed breathing space. No other group of possessed has managed to command ships with the same proficiency as Capone. We will have returned to the small risk of the possessed spreading through quarantine-busting flights, which the Navy should be able to contain as you originally envisaged. Eventually, the possessed will simply remove themselves from this universe entirely. That is when we can begin our true fight back. And do so under a great deal less stress than our current conditions.”

“Is that the decision of this Council?” Samuel asked formally.

“It is,” the President said. “With one abstention.” He glanced at Cayeaux. The Edenist ambassador returned the look unflinchingly. Edenism and Earth held the two other permanent seats on the Polity Council, awarded because of their population size and formed a powerful voting bloc; they were rarely in disagreement over general policy. Ethics, of course, nearly always set the Edenists apart.

“They’re inflicting too much damage on us,” Earth’s ambassador said, adopting a measured tone. “Physically and economically. Not to mention the disintegration of morale propagated by events like Trafalgar, and unfortunately our

arcologies. It has to be stopped. We cannot show any weakness in dealing with this.”

“I understand,” the First Admiral said. “We still have the bulk of Admiral Kolhammer’s task force available in the Avon system. Motela, how long would it take to deploy them?”

“We can rendezvous the Adamist warships above Kotcho in eight hours,” Kolhammer replied. “It will take a little longer for affiliated voidhawk squadrons to gather. Most could join us en route.”

“That will mean we can hit Capone in three days’ time,” Samual said. “I would like some extra time to augment those forces. The tactical simulations we’ve run indicate we need at least a thousand warships to challenge Capone successfully in a direct confrontation. We’ll need to call in reserve squadrons from national navies.”

“You have one week,” the President said.

19

The news of Trafalgar was whispered through the beyond until it reached Monterey, whereupon it sparked jubilation in some quarters.

“We beat the bastards,” Al whooped. He and Jez were fooling around in the Hilton’s swimming pool when Patricia rushed in with the news.

“Sure did, boss,” Patricia said. “There was thousands of the Navy ship crews joined the beyond.” She was smiling brightly. Al couldn’t remember seeing her do that before.

Jezzibella flung herself at Al’s back, wrapping her arms round his neck and her legs round his hips. “Told you Kingsley would make it!” she laughed. She was in her carefree adolescent persona, clad in a gold micro-bikini.

“Okay, yeah.”

She splashed him. “Told you so.”

He tipped her under the water. She shot up again laughing gleefully, a mermaid Venus.

“What about the asteroid?” Al asked. “Did we get the First Admiral?”

“Don’t think so,” Patricia said. “Seems like the antimatter

went off outside. The asteroid is still intact, but it's completely screwed."

Al cocked his head to one side, listening to the multitude of voices murmuring at him, each one suffused with a plea. Rummaging through the nonsense which made up most of it took a while, but eventually he built up a picture of the disaster.

"So what happened?" Jezzibella asked.

"Kingsley didn't get inside. Guess the security nazis were on to him. But he came through all right, Jee-ze did he ever. Wiped out a whole spaceport full of their warships, and a shitload of hardware got busted up with it."

Jezzibella circled round in front of him, and embraced him passionately. "That's good. Smart propaganda."

"How do you figure that?"

"Blew up all their machines, but didn't kill too many people. Looks like you're the good guy."

"Yeah." He rubbed his nose against hers, hands moving round to cup her ass. "Guess I am."

Jezzibella shot Patricia a sly look. "Has anyone broken the good news to Kiera, yet?"

"No. I don't think so." Patricia was smiling again. "You know, I think I'll go tell her."

"She won't let you in her little ghetto," Al said. "Just invite her to the celebrations."

"We're having a celebration?" Jezzibella asked.

"Hey, girl, if this ain't worth one, I don't know what the fuck is. Give Leroy a call, tell him to break out the good booze in the ballroom. Tonight, we are gonna party!"

Kiera stood in front of the lounge's window, staring down at the hellhawks on their docking pedestals. The yammering, pitiful voices of the beyond were intent on explaining the magnitude of the Trafalgar disaster to her. The Organization's triumph infuriated her. Capone was turning out to be a

lot harder to crack than she'd envisioned at the start of her little rebellion. It wasn't just the mystique of his name, or his cleverly insidious hold on the Organization's power structure. Those two facets she could have worn down eventually. He was getting far more than his fair share of luck. For a while the elimination of the antimatter station had tilted events in her favour. With the cancellation of the seeding flights, the fleet had been getting edgy again. Now this. And Capone was well aware of her less-than-loyal actions, even though nothing was out in the open. Yet.

She couldn't see it from this window, but a third of the way round the docking ledge, that little nerd Emmet Morden was trying to rebuild one of the nutrient fluid refineries that she'd disabled. If he succeeded, then she was going to lose, and lose badly. One voice, pathetically eager to please, told her that at least one squadron of voidhawks had perished in the awesome explosion.

"Fuck it!" Kiera stormed. She refused to acknowledge any more of the insidious incorporeal babble. "I didn't know he was cooking this up."

Her two senior co-conspirators, Luigi Balsamo and Hudson Proctor, gave each other a look. They knew how dangerous life became when she was in this kind of mood.

"Me neither," Luigi said. He was sitting on one of the long settees, drinking some excellent coffee and watching her carefully. "Al used a quantity of antimatter for a secret project a while back. I never guessed it was for anything like this. Gotta give him credit, this is going to skyrocket his credibility among the crews."

"That barbarian wouldn't have the intelligence to plan this out by himself," she snapped. "I bet I know who put the idea in his head. Little whore!"

"Smart for a whore," Hudson Proctor said.

"Too smart," Kiera said. "For her own good. I shall enjoy telling her that some day soon."

“It’s going to make life difficult for us though,” Luigi said. “We’ve been getting through to a lot of people recently. There was plenty of support for all of us heading down to the planet.”

“There still is,” Kiera said. “How long is this triumph going to last for him? A week? Two? Ultimately, it changes nothing. He has nothing else to offer. I’ll take the Organization with me to New California, and Capone and his whore can freeze their asses off up here until the remainder of the Confederation Navy comes knocking. See how he likes that.”

“We’ll keep plugging away,” Luigi promised.

“I might be able to turn this to our favour,” Kiera said thoughtfully. “If the crews can be made to see that it’s mainly a propaganda stroke, one that’s got the remaining ninety-nine per cent of the Confederation Navy badly pissed off with us.”

“And are likely to come and settle the score,” Hudson finished excitedly.

“Exactly. And there’s only one place we’ll be truly safe from that retaliation.”

A bleep escaped from an AV pillar on the glass table in front of the settee. Kiera walked over to it in annoyance and keyed an acknowledgement. It was Patricia Mangano, calling to tell them, if they hadn’t already heard, the fabulous news about Trafalgar. And they were all invited to the victory party Al was throwing that evening.

“We’ll be there,” Kiera replied sweetly, and switched off.

“We’re going?” a startled Hudson Proctor asked.

“Oh yes,” Kiera said. Her smile upgraded to pure malice. “This is the perfect alibi.”

Mindori swooped in round the counter-rotating spindle and dropped on the pedestal which Hudson Proctor had assigned it. Rocio didn’t fold in the hellhawk’s distortion field imme-

diately; there was some activity farther up around the rocky ledge that he found interesting. Several non-possessed were in spacesuits, concentrated round a section of machinery that was pinned to the vertical cliff.

How long has that been going on for? He asked Pran Soo in singular engagement mode.

Two days now.

Anyone know what they're doing?

No. But it's nothing to do with Kiera.

Really? The only systems on the ledge are connected with voidhawk and blackhawk maintenance and service.

Gaining the ability to provide us with nutrients is an obvious move for Capone, Pran Soo said. **It would appear our options are finally starting to open up.**

Not for me, Rocio said. **Capone only wants us to compliment the Organization fleet. No doubt he will offer better terms than Kiera's ever done, but we will still be drawn into the conflict. My goal remains achieving complete autonomy for all of us.**

There are now fifteen of us who will provide whatever covert assistance we can. If the Almaden equipment can be made to function, we believe most of the others will join us. With a few noticeable exceptions.

Ah yes, where is Etchells?

I don't know. He still hasn't returned.

We can't have gotten that lucky. Did you check with Monterey's net to see if the electronics we require are in stock?

Yes. Everything is there. But I don't understand how we can get them out. We'll have to ask the Organization direct. Are you going to negotiate with the Organization? The fleet still needs us to patrol local space around the planet; it is not a combat duty.

No. Capone won't take kindly to my deal with Al-

maden; we'll be depriving him of their industrial capability. I believe I can obtain the electronics without the assistance of outside groups.

Rocio used the bitek processors in *Mindori's* life support cabin to establish a link with Monterey's communication net. Last time he had just accessed visual sensors to locate the food storage facilities for Jed. That had been simple enough; this task had an altogether different level of complexity. With Pran Soo's help he gained access to the maintenance files, and tracked down the physical location of the components they wanted. That information wasn't restricted, although they used a false log-on code to make sure there were no incriminating bytes that could ever link them to the components in question. After that, Rocio loaded in a requisition for the items. The spares allocation procedure which Emmet Mordden had erected around Monterey's stock of components had several integral security protocols. Rocio had to bring the hellhawk's on-board processor array into the loop to circumvent the safeguards with a powerful codebuster program. Once they were in the system, he ordered the electronics to be delivered to a maintenance shop outside the section of the spaceport which was under Kiera's physical jurisdiction.

Very good, Pran Soo said. Now what?

Simple. Just walk in and collect them.

Jed studied the route Rocio had devised, trying to spot any flaws. So far, he'd found the depressing number of zero. The hellhawk's possessor was using the big screen in the lounge to display it, though it would also be loaded into the spacesuit's processor. Jed could call it up on the visor's graphics overlay so that this time he wouldn't be reliant on Rocio calling out a stream of directions. He would have to walk about a kilometre along the ledge to reach the designated airlock. No complaints about that, despite having to wear a ballcrusher again. The possessed couldn't use space-

suits, so as long as he was outside there wouldn't be any of the buggers near him. It was inside when his troubles would begin. Again!

"There is a large celebration party due to begin in another fifty minutes," Rocio said, his face taking up a small square on the top right corner of the screen. "That is when you should perform this mission. Most of the possessed will be there, it will minimize the chance of discovery."

"Fine," Jed mumbled. It was hard to concentrate: as well as sitting next to Beth on the couch, he had Gerald pacing up and down behind him, muttering gibberish to himself.

"Half of the components have been delivered to the maintenance shop already," Rocio said. "That's the beauty of a heavily automated system like Monterey. The freight mechanoids don't start asking questions when there's no one there in the shop to receive them. They just dump them and go back for the next batch."

"Yeah, we know," Beth said. "You're a bloody genius."

"Not everyone could pull this off so stylishly."

Jed and Beth shared a look; her hand went across his thigh and squeezed. "Fifty minutes," she murmured.

Gerald walked round the settee and up to the big screen. He held a hand out and traced green dotted route from *Mindori* to the asteroid's airlock, fingers stroking the glass gently. "Show her," he asked quietly. "Show me Marie."

"I can't, I'm sorry," Rocio said. "There's no general net access to the section of the asteroid where Kiera has barricaded herself in."

"Barricaded?" Gerald's face flashed with alarm. "Is she all right? Is Capone shooting at her?"

"No no. Nothing like that. It's all politics. There's a big tussle going on for control of the Organization right now. Kiera's making sure she's safe from any kind of digital prying, that's all."

“Okay. All right.” Gerald nodded slowly. He gripped his hands together, kneading them until his knuckles cracked.

Jed and Beth waited anxiously. This kind of behaviour usually preceded an announcement.

“I’ll go with Jed,” Gerald said. “He’ll need help.”

Rocio gave a deep chuckle. “No way. Sorry, Gerald, but if I let you out, we’ll never see you again. And that just won’t do, now will it?”

“I’ll help him, really I will. I won’t cause any trouble.”

Beth hunched down small in the couch, not meeting anyone’s eye. The pitiful way Gerald kept beseeching them was acutely embarrassing. And physically he was in a bad way, with sweaty skin and dark baggy skin accumulating under his eyes.

“You don’t understand,” Gerald backed away from the screen. “This is my last chance. I’ve heard what you’re saying. You’re not coming back. Marie is here! I have to go to her. She’s only a baby. My little baby. I have to help, have to.” His whole body was shaking, as if he was about to cry.

“I will help you, Gerald,” Rocio said. “Truly I will. But not now. This is critical to us. Jed has to get those components. Just be patient.”

“Patient?” It came out as a strangled gasp. Gerald turned round, his hands ready to claw at the air. “No! No more.” He drew a laser pistol from his pocket.

“Christ,” Jed groaned. His hands went automatically to pat at his jacket. Pointless, he knew it was his pistol all right.

Beth was struggling to her feet, hampered by her arms being caught up with Jed’s panicked movements. “Gerald, mate, don’t,” she cried.

“She’s asking, I’m telling you,” Rocio said sternly.

“Take me to Marie! I’m not kidding.” Gerald aimed the laser at the two entangled youngsters, walking fast towards the couch until the muzzle lens was centimetres from Jed’s forehead. “Don’t use your energistic power on me. It won’t

work.” His free hand tugged at the hem of his sweatshirt, revealing several power cells and a processor block taped to his stomach. They were connected together by various wires. The block’s small screen had an emerald spiral cone that turned slowly. “If this glitches, we all go up. I know how to bypass the cells’ safety locks. I learned that a long time ago. When I was on Earth. Before all this happened. This life I brought them all to. It was supposed to be good. But it isn’t. It isn’t! I want my baby back. I want to make things right again. You’re going to help me. All of you.”

Jed looked directly at Gerald, seeing the way he kept blinking as if in pain. Very slowly, he started to push Beth away from him. “Go on,” he urged when she started to protest. “Gerald isn’t going to shoot you, are you Gerald? I’m your hostage.”

The hand holding the laser pistol wobbled alarmingly. But not by enough for Jed to dodge free. Not that he would, he decided; the power cells saw to that.

“I’ll kill you,” Gerald hissed.

“Sure you will. But not Beth.” Jed kept on pushing at her, until she started to stand.

“I want Marie.”

“We’ll give you Marie, if you let Beth go.”

“Jed!” Beth protested.

“Go on, doll, walk out now.”

“Not bloody likely. Gerald, put that bloody gun down. Switch off the block.”

“*Give me Marie!*” Gerald screamed. Beth and Jed both flinched.

Gerald pressed the pistol against Jed’s skin. “Now! You’ll have to help. I know you’re frightened of the beyond. See, I know what I’m doing.”

“Gerald, mate, with all respect, you haven’t got a fucking clue w—”

“Shut up!” He started panting, as if there wasn’t enough

oxygen in the compartment. "Captain, are you hurting my head? I warned you not to use your power on me."

"I'm not, Gerald," Rocio said hurriedly. "Check the block: there's no glitch, is there?"

"Oh Jesus, Gerald!" Beth wanted to sit down again; the strength was flowing out of her legs.

"There's enough power in the cells to blow a hole in the capsule hull if they detonate."

"I'm sure there is, Gerald," Rocio said. "You've been very clever. You outsmarted me. I'm not going to fight you."

"You think if I go in there that they'll catch me, don't you?"

"It's a pretty good probability, yes."

"But you're flying away after this is all over, aren't you? So it doesn't matter if they catch me, does it?"

"Not if we get the components."

"There you go then." Gerald gave a semi-hysterical giggle. "I'll help Jed load up the components, and then I'll go and look for her. It's easy. You should have thought of it first."

"Rocio?" Beth said desperately. She looked imploringly at the little portion of the screen containing his face.

Rocio considered his options. It was unlikely he could negotiate with the madman. And stalling was useless. Time was the critical factor. He only had another four hours at the most before he finished ingesting his nutrient fluid; he'd been feeding slowly as it was. This opportunity would never be repeated.

"All right, Gerald, you win; you leave with Jed," Rocio said. But remember, I will not let you back on board, under any circumstances. Do you understand that, Gerald? You are absolutely on your own."

"Yes." It was as if the laser pistol's weight had abruptly increased twentyfold; Gerald's arm drooped to hang at his

side. "But you'll let me go? To Marie?" his voice became an incredulous squeak. "Really?"

Beth said nothing while Jed and Gerald suited up. She helped them with their helmet seals, and checked the backpack systems. Their suits contracted around them; Gerald's outlined the power cells around his torso. She'd had a couple of opportunities to snatch the laser pistol from him while he was struggling into the bulky fabric sack. It was the thought of what he might do which had restrained her. This wasn't the bewildered, hurt eccentric she'd been looking out for since Koblat. Gerald's illness had elevated itself to a level that was potentially lethal. She honestly thought he would blow himself up if anyone got in his way now.

Just before Jed closed his visor she kissed him. "Come back," she whispered.

He gave an anxious, brave smile.

The airlock closed and started cycling.

"Rocio!" she yelled at the nearest AV lens. "What the hell are you doing? They'll be caught for sure. Oh Jeeze, you should have stopped him!"

"Name an alternative. Gerald might be dangerously unbalanced, but that trick with the power cells was clever."

"How come you never saw him putting them together? I mean, why aren't you watching us?"

"You want me to watch everything you do?"

Beth blushed. "No, but I thought at least you'd keep an eye on us, make sure we're not messing with you."

"You and Jed can't mess with me. I admit I made a mistake with Gerald. A bad one. However, if Jed does manage to obtain the components, it won't matter."

"It will to Gerald! They'll catch him. You know they will. He won't be able to take that again, not what they'll do to him."

“Yes. I know that. There is nothing I can do. Nor can you. Accept it. Learn how to deal with it. This won’t be the last time you experience tragedy in your life. We all do. I’m sorry. But at least with Gerald out of the way we can get back on track. I am grateful to you for your efforts, and your physical assistance. And I will turn you over to the Edenists. You have my word, for what it’s worth. I can give you nothing else, after all.”

Beth made her way into the bridge. Sensor and camera images filled most of the console screens. She didn’t touch any of the controls, just sat in one of the big acceleration chairs and tried to scope as much as she could all at once. One screen was centred on a pair of spacesuited figures waddling across the smooth rock of the docking ledge. Others were focused on various airlock doors, windows, and walls of machinery. A group of five were relaying pictures from inside the asteroid: a couple of deserted corridors, the maintenance shop with Rocio’s precious stack of pilfered components, and two views of the Hilton lobby where Capone’s guests were arriving for the party.

One girl, barely older than Beth, swept in through the lobby, escorted by two handsome young men. Most people turned to look, nudging each other.

The girl’s exquisite face made Beth scowl. “That’s her, isn’t it? That’s Kiera?”

“Yes,” Rocio said. “The man on her right is Hudson Proctor, I don’t know who the other is. Some poor stud she’s wearing out in bed. The bitch is a complete whore.”

“Well don’t tell Gerald, for Christ’s sake.”

“I wasn’t planning on it. Mind you, most of the possessed go sex-mad to begin with. Kiera’s behaviour is nothing exceptional.”

Beth shuddered. “How much farther has Jed got to go?”

“He’s only just started. Look, don’t worry, he’s got a clear

route, the components are waiting. He'll be in and out in less than ten minutes."

"If Gerald doesn't foul it up."

Bernhard Allsop didn't mind missing the big party. He didn't get on with too many of Al's bigshots. They all sneered and laughed at him behind his back. The possessed ones, that is; the non-posessed treated him with respect, the kind of respect you gave a pissed rattler. It didn't bother him none. Here he was, at the centre of things. And Al trusted him. He hadn't been demoted or sent down to the planet like a lot of lieutenants who didn't measure up. Al's trust meant a hell of a lot more than everyone else's sniggering.

So Bernhard didn't complain when he drew this duty. He wasn't afraid of hard work to get ahead. No sir. And this was one of Al's top projects. Emmet Mordden himself had said so. Second only to the hit against Trafalgar. That was why work wasn't stopping even during the party. Al wanted a whole bunch of machinery fixing. It was stuff connected with the hellhawks. Bernhard wasn't so hot on the technical details. He'd tuned and overhauled auto engines when he was back home in Tennessee, but anything more complex than a turbine was best left to rocket scientists.

He didn't even mind that. It meant he didn't have to get his hands dirty, all he had to do was supervise the guys Emmet had assigned to this detail. Watch for any treachery in the minds of the non-posessed and make sure they pulled the whole shift. Easy. And when it was over, Al would know that Bernhard Allsop had come through with the goods again.

It was a long way through the corridors from Monterey's main habitation quarters to the section of the docking ledge where the refurbishment was being carried out. He didn't have a clue what went on behind all the doors he walked past. This part of the rock was principally engineering shops

and storage rooms. Most of it had fallen into disuse since the Organization had taken over from the New California navy. Which just left miles of well lit, warm corridors all laid out in a three dimensional grid, unused except for the occasional mechanoid and maintenance crew. There were big emergency pressure seal doors every couple of hundred yards, which was how Bernhard got to learn his way around. They all had a number and a letter which told you where you were. Once you'd done it a couple of times, it was kind of like Manhattan, obvious.

Pressure door 78D4, another ten minutes' walk from the nutrient refinery chamber. He stepped over the thick metal rim and started walking along the corridor. It ran parallel to the docking ledge, though he could never make out a curve along the floor, even though he knew it had to be there. The doors on his left led to a couple of maintenance offices with long windows overlooking the ledge, a lounge, an airlock chamber, and two EVA prep rooms. There were only two doors on his right: a mechanoid service department and an electronics repair shop.

A quiet metallic whine made him look up. Pressure door 78D5, sixty yards ahead of him, was sliding across the corridor. Bernhard felt his borrowed heart thump. They only closed if there was a pressure loss. He whirled round to see 78D4 sliding into place behind him.

"Hey," he called. "What's happening?" There were no flashing red lights and shrill alarms like there had been in all the drills. Just unnerving silence. He realized the conditioning fans had stopped; the ducts must have sealed up as well.

Bernhard hurried along towards 78D5, pulling his processor block from his pocket. When he pressed the keys to call the control centre, the screen printed NO NET ACCESS AVAILABLE. He gave it a puzzled, annoyed look. Then he heard a hissing sound start up, growing very loud very quickly. He stood still and looked round again. Halfway

down the corridor, an airlock door was sliding open. It was the one leading out onto the docking ledge. One thing Emmet had emphasised time and again to reassure Organization members from earlier centuries: it was impossible for both airlock doors to open at once.

Bernhard howled in terrified anger, and started sprinting for 78D5. He shoved a hand out, and fired a bolt of white fire. It struck the stolid pressure door and evaporated into violet twinkles. Someone was on the other side, deflecting his energistic power.

Air was surging past him, building to hurricane force and producing short-lived streamers of white mist that curved sinuously round his body. He hammered another bolt of white fire at the pressure door. This time it didn't even reach the dull metal surface before it was negated.

They were trying to murder him!

He reached the slab-like pressure door and pounded against the small transparent port in the centre while the wind clawed at his clothes. Its roar was growing fainter. Someone was moving on the other side of the port. He could sense two minds; one he thought he recognized. Their gratification was horribly conspicuous.

Bernhard opened his mouth and found there was hardly anything left to inhale. He concentrated his energistic power around himself, making his body strong, fighting the sharp tingling sensation sweeping over his skin. His heart was yammering loudly in his chest.

He punched the pressure door, making a tiny dint in the surface rim. Another punch. The first dint straightened out amid a shimmer of red light.

"Help me!" he shrilled. The puff of air was ripped from his throat, but the cry had been directed at the infinity of souls surrounding him. Tell Capone, he implored them silently. It's Kiera!

He was having trouble focusing on the stubborn pressure

door. He punched it again. The metal was smeared with red. It was a fluid this time, not the backspill from energetic power warping physical reality. Bernhard dropped to his knees, fingers scraping down the metal, desperate for a grip. The souls all around him were becoming a lot clearer.

“What’s that?” Jed asked. He hadn’t spoken to Gerald since they walked down the *Mindori*’s stairs, and even then it had only been to tell him the direction they were to take. They’d walked along together ever since, trudging past the feeding hellhawks. Now they were on a section of ledge unused by either Kiera or Capone. No man’s land. The purple physiology icons projected against his visor told their usual sorry tale: his heart-rate was too high, and his body was hotter than it should be. This time he’d steered clear of snorting an infusion to calm his jabbering thoughts. So far.

“Is there a problem?” Rocio asked.

“You tell me, mate.” Jed pointed at the cliff wall, fifty metres ahead. A horizontal fountain of white vapour was gushing out of an open airlock hatch. “Looks like some kind of blow out.”

“Marie,” Gerald wheezed. “Is she there? Is she in danger?”

“No, Gerald,” Rocio said, an edge of exasperation in his voice. “She’s nowhere near you. She’s at Capone’s party, drinking and making merry.”

“That’s a lot of air escaping,” Jed said. “The chamber must have breached. Rocio, can you see what’s going on in there?”

“I can’t access any of the sensors in the corridor behind the airlock. That section of the net has been isolated. There isn’t even a pressure drop alert getting out to the asteroid’s environmental control centre. The corridor has been sealed. Someone’s gone to a lot of trouble concealing whatever the hell they’re up to.”

Jed watched the spurt of gas die away. "Shall we keep going?"

"Absolutely," Rocio said. "Don't get involved. Don't draw attention to yourselves."

Jed glanced along the line of blank windows above the open airlock. They were all dim, unlit. "Sure thing."

"Why?" Gerald asked. "What's in there? Why don't you want us to see? It's Marie, isn't it? My baby's in there."

"No, Gerald."

Gerald took a few paces towards the open airlock.

"Gerald?" Beth's voice was high, strained and excitable. "Listen to me, Gerald, she's not in there. Okay? Marie's not there. I can see her, mate, there are cameras in the big hotel lobby. I'm looking at her right now. I swear it, mate. She's in a black and pink dress. I couldn't make that up, now could I?"

"No!" Gerald started to run, a laboured half-bouncing motion. "You're lying to me."

Jed stared after him in mounting dismay. Short of letting off a flare, there was nothing more he could do to attract attention to them.

"Jed," Rocio said. "I'm using your private suit band, Gerald can't hear this. You have to stop him. Whoever opened that airlock isn't going to want him blundering in. And they have to be a major faction player. This could ruin our whole scheme."

"Stop him how? He'll either shoot me or blow both of us into the bloody beyond."

"If Gerald triggers an alarm, none of us will ever get off this rock."

"Oh *Jeeze*." He shook his fist helplessly at Gerald's crazy lurching run. The loon was fifteen metres from the open airlock.

"Take a hit," Beth said. "Chill down before you go after him."

“Fuck off.” Jed started to run after Gerald, convinced the whole world was now watching. And worse, laughing.

Gerald reached the open airlock, and ducked inside. By the time Jed arrived half a minute later, he was nowhere to be seen. The chamber was standard, like the one Jed had come though last time he’d gone inside this bloody awful maggot nest of rock. He moved along it cautiously. “Gerald?”

The inner door was open. Which was deeply wrong. Jed knew all about asteroid airlocks, and one thing you could positively not ever do was open an internal corridor to the vacuum. Not by accident. He glanced at the rectangular hatch as he passed, seeing how the swing rods had been sheered, the melted cables around the rim seal interlock control.

“Gerald?”

“I’m losing your signal.” Rocio said. “I still can’t access the net around you. Whoever did it is still there.”

Gerald was slumped against the corridor wall, legs splayed wide in front of him. Not moving. Jed approached him cautiously. “Gerald?”

The suit band transmitted a shallow, frightened whimper.

“Gerald, come on. We’ve got to get out of here. And no more of this crazy shit. I can’t take it any more, okay. I mean really can’t. You’re cracking my head apart.”

One of Gerald’s gauntleted hands waved limply. Jed stared past him, down to the end of the corridor. A dangerous geyser of vomit threatened to surge up his throat.

Bernhard Allsop’s stolen body had ruptured in a spectacular fashion as the energistic power reinforcing his flesh had vanished. Lungs, the softest and most vulnerable tissue, had burst immediately, sending litres of blood pouring out of his mouth. Thousands of heavily pressurized capillaries just beneath his skin had split, weeping beads of blood into the fabric of his clothes. It looked as though his double breasted

suit was made from brilliant scarlet cloth—cloth that seethed as if alive. The fluid was boiling away into the vacuum, surrounding him with a hazy pink mist.

Jed attacked his suit wrist pad as if it was burning him. Dry air scented with peppermint and pine blew into his face. He clamped his jaw shut against the rising vomit, turning bands of muscle to hot steel as he forced himself not to throw up. This spacesuit wasn't sophisticated enough to cope with him spewing.

Something loosened inside him. He coughed and spluttered, sending disgustingly tacky white bile spraying over the inside of his visor. But his nausea was subsiding. "Oh God, oh Jeeze, he's just pulped."

The pine scent was strong now, thick in his helmet, draining feeling away from his limbs. His arms moved sluggishly, yet they were as light as hydrogen. Good sensation.

Jed let out a snicker. "Guess the guy couldn't hold it together, you know?"

"That's not Marie."

The processor governing Jed's spacesuit cancelled the emergency medical suppresser infusion. The dosage had exceeded CAB limits by a considerable margin. It automatically administered the antidote. Winter fell across Jed, chilling him so badly he held a gauntlet up to his visor, expecting to see frost glittering on the rubbery fabric. The coloured lights flashing annoyingly into his eyes gradually resolved into icons and digits. Someone kept chanting: "Marie, Marie, Marie."

Jed looked at the corpse again. It was pretty hideous but it didn't make him feel sick this time. The infusion seemed to have switched off his internal organs. It also implanted a strong sensation of confidence, he could tackle the rest of the mission without any trouble now.

He shook Gerald's shoulder, which at least put an end to

the dreary chanting. Gerald squirmed from the touch. "Come on, mate, we're leaving," Jed said. "Got a job to do."

A motion caught Jed's attention. There was a face pressed up against the port in the pressure door. As he watched, the blood smearing the little circle of glass began to flow apart. The man on the other side stared straight at Jed.

"Oh bloody hell," Jed choked. The balmy feeling imparted by the infusion was gusting away fast. He turned frantically to see the airlock's inner hatch starting to close.

"That's it, mate, we're outta here." He pulled Gerald up, propping him against the wall. Their visors pressed together, allowing Jed to look into the old loon's helmet past the winking icons. Gerald was oblivious to anything, lost in a dream-state trance. The laser pistol slid from lifeless fingers to fall onto the floor. Jed glanced longingly at it, but decided against. If it came to a shootout with the possessed, he wasn't going to win. And it would only piss them off. Not a good idea.

The face at the port had vanished. "Come on." He tugged at Gerald, forcing him to take some steps along the corridor. Thin jets of grey gas started to shoot out of the conditioning vents overhead. Green and yellow icons appeared on his visor, reporting oxygen and nitrogen thickening around him. One thing Jed clung to was that the possessed were no good in a vacuum; suits didn't work, and their power couldn't protect them. As soon as he got back out on the ledge he was safe. Relatively.

They reached the airlock hatch, and Jed slapped the cycle control. The control panel remained dark. Digits were flickering fast across his visor; the pressure was already twenty-five per cent standard. Jed let go of Gerald and pulled the manual lever out. It seemed to move effortlessly as he spun it round and round. Then it jarred his arms. He frowned at it, cross that something as simple as a lock should try to hurt him. But at least the hatch swung open when he pulled on it.

Gerald stumbled into the chamber, as obedient as a mechanoid. Jed laughed and cheered as he pulled the hatch shut behind him.

“Are you all right?” Rocio asked. “What happened?”

“Jed?” Beth cried. “Jed, can you hear me?”

“No sweat, doll. The bad guys haven’t got what it takes to spin me.”

“He’s still high,” Rocio said. “But he’s coming down. Jed, why did you use the infuser?”

“Just quit bugging me, man. Jeeze, I came through for you, didn’t I?” He pressed the outer hatch’s cycle control. Amazingly, a line of green lights on the panel turned amber. “You’d have snorted a megawatt floater too if you saw what I did.”

“What was that?” Rocio’s voice had softened down to the kind of tone Mrs Yandell used when she talked to the day-club juniors. “What did you see, Jed?”

“Body.” His irritation at the insulting tone was lost under a memory of wriggling scarlet cloth. “Some bloke got caught in the vacuum.”

“Do you know who he was?”

“No!” Now he was sobering up, Jed desperately wanted to avoid thinking about it. He checked the control panel, relieved to see the atmosphere cycle was proceeding normally. The electronics at this end of the airlock were undamaged. Not sabotaged, he corrected himself.

“Jed, I’m getting some strange readings from Gerald’s suit telemetry,” Rocio said. “Is he okay?”

Jed felt like saying: was he ever? “I think the body upset him. Once he realized it wasn’t Marie, he just shut up.” And who’s complaining about that?

The control panel lights turned red, and the hatch swung open.

“You’d better get out of there,” Rocio said. “There’s no

alert in the net yet, but someone will discover the murder eventually.”

“Sure.” He took Gerald’s hand in his and pulled gently. Gerald followed obediently.

Rocio told them to stop outside a series of horseshoe-shaped garage bays at the base of the rock cliff, a hundred metres from the entrance they were supposed to use to get into the asteroid. Three trucks were parked in the bays, simple four wheel drive vehicles with seating for six and a flatbed rear.

“Check their systems,” Rocio said. “You’ll need one to drive the components back to me.”

Jed went along them, activating their management processors and initiating basic diagnostic routines. The first one was suffering from some kind of power cell drop out, but the second was clean and fully charged. He sat Gerald in one of the passenger seats, and drove it round to the airlock.

When the chamber’s inner hatch swung open, Jed checked his sensor reading before he cracked his visor up. A lifetime of emergency procedure drills back on Koblat made him perpetually cautious about his environment.

“There’s nobody even close to you,” Rocio said. “Go get them.”

Jed hurried along the corridor, took a right turn, and saw the broad door to the maintenance shop, three down on the right. It opened for him as he touched the lock panel. The lights sprang up to full intensity, revealing a basic rectangular room with pale-blue wall panelling. Cybernetic tool modules stood in a row down the centre, encased in crystal cylinders to protect their delicate waldos. A grid of shelving covered the rear wall, intended to hold a stock of spares used regularly by the shop. Now there were just a few cartons and packages left scattered around—apart from the large pile in the middle which the mechanoid had delivered.

“Oh Jeeze, Rocio,” Jed complained. “There’s got to be a

hundred here. I'm never going to muscle that lot out, it'll take forever." The components were all packed in plastic boxes.

"I'm getting a sense of déjà vu here," Rocio said smoothly. "Just pile them onto the freight trolley and dump them in the airlock chamber. It'll be three trips at the most. Ten minutes."

"Oh brother." Jed grabbed a trolley and shoved it over to the shelving. He started to throw the boxes on. "Why didn't you get the mechanoids to dump them at the airlock for me?"

"It's not a designated storage area. I would have had to re-program the management routines. Not difficult, but it might have been detected. This method reduces the risk."

"For some," Jed muttered.

Gerald walked in. Jed had almost forgotten him. "Gerald, you can take your helmet off, mate." There was no response.

Jed went up to him and flipped the helmet seals. Gerald blinked as the visor was raised.

"Can't stay in that spacesuit here, mate, you'll get noticed. And you'll suffocate eventually."

He thought Gerald was about to start crying, the bloke looked so wretched. To cover his own guilt, Jed went back to loading the boxes. When he had as many as the trolley could handle, he said: "I'm going to get rid of this bundle. Do me a favour, mate, start loading the next lot."

Gerald nodded. Even though he wasn't convinced, Jed hurried out back to the airlock. When he got back, Gerald had put two boxes on the second trolley.

"Ignore him," Rocio said. "Just do it yourself."

It took a further three trips to carry all the boxes to the airlock. Jed finished loading the trolley for the last time, and paused. "Gerald, mate, look, you've got to get a grip, okay?"

"Leave him," Rocio said curtly.

"He's gone," Jed said sadly. "Total brainwipe this time. That corpse did for him. We can't leave him here."

"I will not permit him back on board. You know what a danger he has become. We cannot treat him."

"You think this gang are going to help him?"

"Jed, he did not come here looking for their help. Don't forget he has a homemade bomb strapped to his waist. If Capone does become unpleasant with Gerald, he's going to be in for a nasty surprise himself. Now get back to the airlock. Beth and your sister are the people you should be concentrating on now."

More than anything, Jed wanted another dose out of the suit's medical kit. Something to take away the hurt of abandoning the crazy old man. "I'm real sorry, mate. I hope you find Marie. I wish she wasn't, well . . . what she is now. She gave a lot of us hope, you know. I guess I owe both of you."

"Jed, leave now," Rocio ordered.

"Screw you." Jed steered the trolley at the wide door. "Good luck," he called back.

He forced himself not to go fast on the drive back to the *Mindori*. There was too much at stake now to risk drawing attention to himself by a last minute error. So he resisted twisting the throttle as he passed the fateful airlock with the corpse behind it. Rocio said the net in that section had returned to full operation and the corridor's emergency doors had opened, but no one had found the body yet.

Jed drove under the big hellhawk and parked directly below one of its barnacle-like cargo holds. Rocio opened the clamshell doors, and Jed set about transferring the boxes over onto the loading platform which telescoped down. At the back of his mind he knew that when the last box was on board, then he and Beth and the kids were no longer necessary. And probably a liability to boot.

He was quite surprised to be allowed back up the ladder into *Mindori's* airlock. Shame finally overwhelmed him

when he took his helmet off. Beth was standing in front of him, ready to help with his suit; face composed so she didn't show any weakness. The enormity of everything he'd done snatched the strength from his legs. He slid down the bulkhead, and burst into tears.

Beth's arms went round him. "You couldn't help him," she crooned. "You couldn't."

"I never tried. I just left him there."

"He couldn't come back on board. Not now. He was going to blow us up."

"He didn't know what the hell he was doing. He's mad."

"Not really. Just very sick. But he's where he wanted to be, near Marie."

Jack McGovern drifted back into consciousness aware of a sharp, deep stinging coming from his nose. His eyes fluttered open to see dark-brown wood crushed against his cheek. He was lying on floorboards in near darkness in the most uncomfortable position possible, with his legs bent so his feet were pressing into his arse and his arms twisted behind his back. Blood was pounding painfully in his forearms. His hangover was the greatest yet. When he tried to stir, he couldn't. His wrists and ankles were all bound up together by what felt like a ball of red hot insulating tape. An attempt to groan revealed his mouth was also covered with tape. One nostril was clogged with dry blood.

That frightened him badly, sending pulse and breathing wild. Air hissed and thrummed through his one small vulnerable air passage. It was like reinforcement feedback, making him even more aware of how dependant he was. Attempting to hyperventilate and half-suffocating because of it made his head pound worse than ever. His vision vanished under a red sparkle.

Insensate panic dragged on for an indeterminable time. All he knew was that when his sight finally returned along

with his sluggish thoughts, his breathing was slowing. His attempted thrashing had shifted him several centimetres across the floorboards. He calmed a lot then, still wishing his hangover would fuck off and leave him alone. The memory of what had happened in the Black Bull's toilet trickled back into his mind. He found that the tape across his mouth didn't stop him from whimpering at the back of his throat.

A possessed! He'd been mugged by a possessed. Yet . . . he wasn't possessed himself, which is what they always did to people—everyone knew that. Unless this was the beyond?

Jack managed to roll round onto his side and take a look round. Definitely not the beyond. He was in some kind of ancient cube of a room, a half-moon window set high up on one wall. Old store display placards were stacked opposite him, fading holophorescent print advertising brands of bathroom accessories he could dimly remember from his childhood. A heavy chain led from his ankles to a set of metal pipes that ran straight up from the floor to the ceiling.

He shuffled along the floor for all of half a metre, until the chain was tight. Nothing he did after that even scratched the pipes, let alone weakened them or made them bend away from the wall. He was still three metres from the door. Bracing and clenching his arm and shoulder muscles had the solitary effect of making his wrists hurt more. That was it then. No escape.

His hangover had long abated when the door finally opened. He didn't know when; only that hours and hours had passed. Cold arcology night light slithered in through the high window, painting the bare plaster walls a grubby sodium yellow. It was the possessed man who came in first, moving without sound, his black monk robe swirling round him like orderly mist. Two others followed him in, a young teenage girl and a sulky, adolescent boy. They were hauling a woman along between them; middle-aged, her shoulders

slumped in defeat. Her chestnut hair was arranged in a pleated crown, as if she'd put it up ready for a shower; wisps had escaped to dangle in front of her eyes. It hid most of her face, though Jack could make out the broken, lonely expression.

The boy bent down and yanked the tape over Jack's mouth as hard as he could. Jack grunted at the pulse of pain as it ripped free. He gulped down air.

"Please," he panted. "Please don't torture me. I'll surrender, okay. Just fucking don't."

"Wouldn't dream of it," Quinn said. "I want you to help me."

"I'm yours. Hundred per cent! Anything."

"How old are you Jack?"

"Hu . . . uh, twenty-eight."

"I'd have put you older, myself. But that's fine. And you're about the right height."

"What for?"

"Well, see, Jack, you got lucky. We're gonna smarten you up a bit, give you a makeover. You're gonna be a whole new man by the time we're finished. And I won't even charge you for it. How about that?"

"You mean different clothes and stuff?" Jack asked cautiously.

"Not exactly. You see, I found out that Greta here is a fully qualified nurse. Course, some assholes would call that synchronicity. But you and I know that's total bullshit, don't we Jack."

Jack grinned round wildly. "Yeah! Absolutely. No fucking way."

"Right. It's all part of His plan. God's Brother makes sure everything comes together for me. I am the chosen one, after all. Both of you are His gifts to me."

"You tell him, Quinn," Courtney said.

Jack's grin had been frozen into place by the aching real-

ization of how deep into their shared insanity he'd fallen. "A nurse?"

"Yep." Quinn signalled Greta forwards.

Jack saw she held a medical nanonic package. "Oh Jesus fuck, what are you going to do?"

"Hey, asshole, Jesus is dead," Courtney shouted. "Don't you go calling his name around us, he can't help you. He's the false lord. Quinn is Earth's new messiah."

"Help me!" Jack yelled. "Somebody help."

"Mouthy little turd, ain't he," Billy-Joe said. "Ain't no body gonna hear you, boy. They didn't hear any of the others, and Quinn hurt them a fuck of a lot more."

"Look, I said I'd help you," Jack said desperately. "I will. Really. I'm not bullshitting. But you gotta keep your end of the bargain. You said no torture."

Quinn walked back to the door, putting as much distance as he could between himself and Jack in the small room. "Is it working now?" he asked Greta.

She looked at the small display on her processor block. "Yes."

"Okay. Start by getting rid of his vocal cords. Billy-Joe's right, he talks too much. And I need him to be quiet when I use him. That's important."

"No!" Jack yelled. He started to squirm round on the floor.

Billy-Joe laughed and sat down hard on his chest, forcing the air out of his lungs. It fluted weakly as it escaped through his nostril.

"The package can't remove his vocal cords," Greta said in a disinterested monotone. "I'll have to disengage the nerves."

"Fine," Quinn said. "Whatever."

Jack stared right at her as she leaned over and applied the glossy green package to his throat. Direct eye to eye contact, the most personal human communication there was. Plead-

ing, imploring. *Don't do this.* He could have been looking into a mechanoid's sensor lens for the effect it had on her. The package adhered to his skin, soft and warm. He clenched his throat muscles against the invasion. But after a minute or so they began to relax as he lost all feeling between his jaw and his shoulders.

Silencing him was just the beginning. He was left alone as the package did its work, then the four of them returned. This time Greta was carrying a different type of nanonic package, a face-mask with several sac-like blisters on the outer surface, inflated by some glutinous fluid. There were no slits for him to see out through when she placed it over his face.

That was when the routine started. Every few hours they would return and remove the mask. Greta would refill the sacs. His face would be examined, and Quinn would issue a few instructions before the mask was replaced. Occasionally they'd give him cold soup and a cup of water.

He was left alone in a darkness that was frightening in its totality. His face was numbed by the package, and whatever it was doing prevented even the red blotches that usually appeared behind closed eyelids. That just left him with hearing. He learned how to tell the difference between night and day. The half-moon window let in a variety of sounds, mostly traffic flowing along the big elevated motorway running down the middle of the Thames. There was also the sound of boats, swans and ducks squabbling. He began to get a feel for the building, too. Big and old, he was sure of that; the floorboards and pipes conducted faint vibrations. In the day there was some activity. Whirring sounds that must be lifts, clumping as heavy objects were moved around. None of it close to his room.

At night there was screaming. A woman, starting with a pitiful wail which was eventually reduced to miserable sobbing. Each time the same, and not far away. It took a while

for him to realize it was Greta. Obviously, there were worse things than having your features modified by a nanonics package. The knowledge didn't act as much of a comfort.

The ghosts knew the Orgathé were approaching Valisk's northern endcap, their new awareness perceiving black knots of menacing hunger sliding through the air. It was enough to overcome their apprehension towards the humans that hated them, sending them fleeing into the caverns harbouring their ex-hosts.

Their presence was one more complication for the defenders. Although the personality could watch the Orgathé flying along the habitat, it certainly didn't know where they'd land. That left Erentz and her relatives with the entire circumference to guard. They'd already decided that it would be impossible to move the thousands of sick and emaciated humans from the front line of the outer caverns. Flight time down the length of the habitat was barely fifteen minutes, and the Orgathé emerging from the southern end cap were joined by several new arrivals who had just entered through the starscrapers. There simply wasn't time to prepare, all they could do was snatch up their weapons and assemble in teams ready to respond to the nearest incursion; even the way they were spaced round the endcap was less than ideal.

Wait until they get inside, the personality said. **If you fire while they're still in the air, they'll just swoop away. Once they're in the caverns they can't escape.**

The Orgathé hesitated as they glided down towards the scrub desert, in turn sensing the hatred and fear of the entities below. For several minutes they circled above the cavern entrances as the last ghosts fled inside, then the flock descended.

Thirty-eight of the buggers. Stand by.

Tolton shifted his grip on the incendiary torpedo launcher

as Erentz told him to get ready. His sweat was making its casing slippery. He was standing behind Dariat, who in turn was at the tail end of a group of his relatives waiting in a passage at the back of one of the hospital caverns. What he thought of as his special status hadn't exempted him from this brand of lethal madness.

He heard a lot of groaning start up in the cavern. It quickly degenerated into weak screams and shouted curses. The ghosts were flooding in, ignoring the bedridden humans to plunge deeper into the cavern network. They started to run past him, mouths open to yell silent warnings. Their movements sketched short-lived smears of washed-out colour through the air.

Then one of the Orgathé hit the entrance outside. Its body elongated, the front section pressing forward eagerly through the curving passageway, while the bulbous rear quarter squirmed violently, adding to its impetus. Those ghosts that had only just made it inside were engulfed by writhing appendages as the huge creature surged along. Their savage cries of suffering penetrated the entire endcap as their life-energy was torn away from them. The other ghosts and Dariat could actually hear them, while the humans experienced their torment as a wave of profound unease. Tolton looked down at the launcher for reassurance, only to find his hands were trembling badly.

"We're on!" Erentz barked.

The Orgathé charged into the cavern, preceded by a hail of freezing polyp pebbles and a technicolor ripple of terrified ghosts. Ahead of it, three rows of grubby bedding were laid out across the polyp floor, home to over 300 lethargic patients, already disturbed by the ghosts. They did their best to retreat, staggering or crawling back against the wall; some of the nurses managed to lug their charges towards the passageways. The Orgathé lunged forwards greedily, turning the cavern into a riot of hysterical bodies and slashing

appendages. Each time it coiled a tentacle around someone their body turned to solid ice and shattered, releasing a ghost that sank to its knees and waited for the devastating follow-up blow.

Through it all, Erentz and her relatives attempted to spread out and encircle the Orgathé. Every metre of ground had to be fought over, elbowing through the throng of terrified people. Blankets, plastic cartons, and chunks of rock-hard frosted flesh were kicked about underfoot, making every step treacherous. The pincer movement was never going to work properly; the best they could hope for was positioning themselves close to the passageways, blocking the Orgathé's escape.

When they had five of the possible seven exit routes covered, they opened fire. A cowering Tolton saw slivers of dazzling light pulse through the air to be absorbed by the Orgathé's nebulous form, and assumed that was the signal to start firing. He pushed a couple of elderly, enfeebled men aside and brought his own launcher up. His mind was so battered by the sight of panic and devastation across the cavern floor he barely aimed it. He just pulled the trigger and watched numbly as the incendiary torpedoes pummelled the dark mass.

The flame throwers opened fire with a raucous howl, adding their particular brand of carnage to the onslaught. Eight lines of bright yellow fire jetted over the heads of the cowering crowd to flower open against the Orgathé. The beast jerked frenziedly, buffeted from all sides by the terrible flame. Its constituent fluid boiled furiously, sending clouds of choking mist to saturate the beleaguered cavern.

Tolton clamped a hand over his mouth as his eyes smarted. The vapour was colder than ice, condensing over his skin and clothes to form a slick mucus-like film. He had trouble standing as it built up underfoot. All around him people were falling over and skating across the floor. He

couldn't aim the launcher with any accuracy now, the recoil from each shot sent him slithering back wildly. In any case, he wasn't entirely sure where the creature was any more. The mist was fluorescing strongly as the jets of flame continued to seer through it, turning the whole cavern into a uniform topaz haze.

Without any visible target, Tolton stopped firing. People were everywhere, shrieking and crying as they skidded about, a racket which fused with the roar of the flame throwers to create total sonic bedlam. Any random shot would probably hit someone. He dropped to all fours and tried to find the cavern wall, a way out.

Erentz and the others kept on firing. The personality's perception of the cavern through its sensitive cells was less than perfect, but it could keep them informed of the Orgathé's approximate location. Erentz twisted about continually, keeping the flame playing on the creature's flanks. With the billowing mist, running figures, and the target continually shrinking, she had a lot of trouble keeping aligned. But it was working: that mattered above all else, helping to blank the knowledge of what a misapplied jet would strike.

Dariat finally perceived the Orgathé's denuded ghost flying back out into the habitat. He shared his enhanced cognition with his relatives and the personality, showing them the wraith flashing past. The light and sound of the flame throwers swiftly died away.

As the disgustingly clammy mist descended out of the air to congeal over people and polyp alike, it revealed a floor littered with bodies. Those who hadn't been too badly burnt or had escaped the Orgathé's slashing appendages were wriggling mutely beneath the slick membranous muck. Nearly a third remained motionless; whether they were too exhausted or wounded to make an effort was impossible to tell. The grungy fluid concealed details.

Tolton watched with numb incredulity as ghosts started to

rise up out of the floor like humanoid mushrooms, stretching elastic fronds of the fluid with them. They were harvesting the material as Dariat had done, cloaking their form with substance.

Erentz and her team were striding through the slaughter and misery as if it didn't exist, whooping out greetings to each other as they congregated by one of the side passageways. Dr Patan was among them, wiping sloppy goo from his face and grinning with the same vivacity as the others as he checked his launcher.

Tolton stared after them as they hurried off down the passageway, totally immune to the suffering throughout the cavern. The personality had informed them of another visitor raising hell in a cavern close by, and they were eager to resume the fight. It wasn't just entropy which was stronger in this continuum, he reflected; inhumanity was equally pervasive.

Eventually he stirred himself, though he was uncertain what to do next. Dariat came over to stand at his side, and they surveyed the cavern with its dead, its wounded, and its enervated ghosts. Together they moved out to offer what comfort they could.

The mask came away cleanly from Jack McGovern's face. He blinked against the gentle light coming through the storeroom's high window. Without the package, his bare skin was host to a peculiar sensation, somewhere between numb and sore. What he wanted to do was dab at it with his hands, trace his fingertips over his cheeks and jaw to find out what they'd done to him. But he was still bound up with the tape and chain.

"Not bad," Courtney said. She gave Greta an affectionate slap on the arm. The woman flinched badly; muscles on her neck and limbs twitched in a cascade reaction.

"Even got the eye colour right."

“Show him,” Quinn said.

A giggling Courtney bent down and thrust a small mirror at Jack. He stared at the image. It was the last thing he expected; they’d given him Quinn’s face. He frowned the question.

“You’ll see,” Quinn said. “Get him ready.” A single gesture, and the chain fell from Jack’s ankles. The tape wasn’t so simple. Billy-Joe produced a vicious-looking combat knife, and started sawing.

Returning blood brought pain roaring into Jack’s feet and hands as the tape was prised away. He couldn’t stand. Courtney and Billy-Joe had to drag him out between them. First stop was a staff washroom. They dumped him in a shower cubicle, and turned the nozzle on full. Cold water sluiced down, making him gag, batting feebly at the spray. Dark stains seeped out of his trousers. Never once had they let him use a toilet.

“Take your clothes off,” Quinn ordered. He chucked a tube of soap gel down onto the cracked tiles. “Wash thoroughly. That stink is a giveaway.”

They stood round, watching as he slowly opened the seals on his shirt and trousers. Feeling and movement was slow to return to his extremities. He had a lot of trouble keeping hold of the tube as he applied the gel. Standing was also very painful, it felt like he was tearing tendons as his knees straightened out. But it was Quinn who’d told him to stand, and he didn’t dare not.

Quinn snapped his fingers, and Jack was abruptly dry. Courtney handed him a black robe. Its cut was identical to Quinn’s, voluminous arms and deep hood, but it was just ordinary cloth, not the patch of empty space which clung to the dark messiah.

Courtney and Billy-Joe inspected them as they stood side by side. Height was almost the same, within three centimetres. A slight weight difference was obscured by the robe.

“God’s Brother must be laughing His ass off,” Billy-Joe said. “Shit, it’s like you’s twins.”

“It’ll do,” Quinn decided. “Any updates on her position?”

“No way, man,” Billy-Joe said, suddenly serious. “Those dudes from the Lambeth coven swore on it. It’s a big fucking deal for them having another High Magus visiting the arcology, especially now. They’s all talking about how this is His time. But she’s staying put in her tower, won’t move, won’t see anyone, not even London’s High Magus. And she’s a real pain in the ass, they all say that. Who else is it gonna be?”

“You’ve done good, Billy-Joe,” Quinn said. “I won’t forget that, and neither will He. When I bring Night to this arcology I’ll let you loose inside a model agency. You can keep yourself a harem of the hottest babes there are.”

“All right!” Billy-Joe punched the air. “Rich bitches, Quinn. I want me some rich bitches, all dressed up real fine in silk and stuff. They always wear that for their own kind, don’t even look at the likes of me. But I’m gonna show them what its like to fuck with a real man.”

Quinn laughed. “Shit, you don’t ever change.” He took another look at Jack, and nodded in satisfaction. The man was eerily similar to himself. It ought to be enough. “Do it,” he told Courtney.

She pushed Jack’s hood aside, and pressed a medical spray to his neck.

“Just to keep you calm,” Quinn said. “You’ve handled this all right so far, I’d hate for you to blow it now.”

Jack didn’t know what the drug was, only that it buzzed warmly in his ears. The fear of what was going to happen to him set sail and drifted away. Just standing still and admiring the glistening droplets form around the shower nozzle was fascinating entertainment. Their fall was an epic voyage.

“Come here,” Quinn said.

It was a very loud voice, Jack thought. But he had nothing else to do, so he slowly walked over to where Quinn was

standing. Then his skin grew cold, as if a winter breeze was flowing through his robe. The room began to change, its drab colours melting away. The walls and floor became simple planes of thick shadow. Billy-Joe, Courtney, and Greta were blank statues, frothing with iridescence. Other people became visible, everything about them was clearly defined, their features, clothes (odd, ancient styles), hair. Yet they lacked colour to the point of translucency. And they were all so sad, mournful faces with anguished eyes.

“Ignore them,” Quinn said. “Bunch of assholes.” By contrast to the others, Quinn was vibrant with life and power.

“Yes.”

Quinn gave him a sharp look, then shrugged. “Yeah well, I suppose we’re not really talking. After all, you’re not actually alive in here.”

Jack contemplated that. His thoughts were losing their sluggishness. “What do you mean?” He realized he couldn’t hear his heart beating any more. Nor was his mouth moving when he spoke.

“Shit.” Quinn’s exasperation manifested itself as a tide of warmth flooding from his shining body. “The hypnogenic doesn’t work here, either. Should have figured that. Okay, let’s put it real simple for you. Do as I say, or I’ll hurt you real bad; and in this realm that can be very bad indeed. Understand?”

They started to slide through the room. Jack didn’t know how; his legs weren’t moving. The wall came at him, and passed by with a stinging sensation that made his thoughts quake.

“It’ll get worse,” Quinn said. “Going through thick chunks of matter is painful. Ignore it, just you sit back and enjoy the view.” They started to pick up speed.

Banneth had tired of the acolytes. Even watching them fuck-
ing each other senseless was a bore. It was all so ordinary.

She kept thinking of the improvements and modifications she could make to their thrashing bodies to spice up the sex and make it potentially a great deal more interesting. There were definitely attributes she could bestow upon the boy to make him more ruthless, both in bed and in life, the first arena acting as a training ground for the second. After critical deliberation, she concluded the girls would probably both benefit from a more feline nature.

Not that any of it mattered now. She'd acquired the same kind of fatalism as the rest of the planet's population. Since the vac-train shutdown, absenteeism and petty crime had increased considerably in every arcology. After an initial flurry of concern, the authorities had decided such actions were not in fact precursors to wholesale possession. Basically, it was people taking the news badly. Apathy had risen to rule with all the intangible force of a dominant star sign.

Banneth pulled on her robe and walked out of the penthouse's master bedroom, not even glancing back at the fresh outburst of moaning from the tangle of bodies on the mattress behind her. She went over to the lounge area's cocktail bar and poured herself a decent measure of Crown whisky. Four days' inactivity floating round the apartment had reduced the bottle's contents down to the last couple of centimetres.

She settled back into one of the atrocious leather chairs and datavised the room's management processor. Tasselled curtains swished shut across the glass wall, cutting off the sight of the night-time arcology. A holographic screen above the fireplace bar flared with colour, giving her a feed from the local news station.

Another two of New York's domes had succumbed to the possessed. Rover reporters relayed the images from the vantage point of a megatower, revealing a faint red glow emanating from the buildings inside the geodesic crystal roof. Police in Paris claimed they had captured nineteen more

possessed and thrown them into zero-tau pods. There were interviews with dazed ex-hosts; one claiming to have been taken over by Napoleon; another swore she'd been used by Eva Perón. From Bombay a terse official statement assured residents that local disturbances were under control.

Several times the station switched back to that morning's address by the President, who had asserted that there were no new incidents of suspected possession. He said his decision to shut down the vac-trains was now fully justified. Local law enforcement agencies were successfully keeping the possessed confined in the regrettable cases where they'd managed to establish themselves in arcologies. He called on all people to pray for New York.

Banneth took another sip of the Crown, enjoying the all-too-rare sensation of alcohol seeping through her synapses. **No mention of London, then.**

None at all, Western Europe confirmed. I'm not even suppressing any. He's being remarkably restrained.

If he's here.

He is.

You shut down the vac-trains awful quick.

I didn't.

Really? Banneth perked up at that. Any information she could gather on B7 always fascinated her. In all the years she'd been working for them, she'd learned so little about how they operated. **Who did?**

A flash of pique escaped along the affinity link. **An idiotic colleague panicked. Sadly, not all of us are completely focused on the problem.**

How many are there?

No. Old habits die hard, and the habit of secrecy is very old indeed in my case. You should appreciate that, with your obsession in behavioural psychology.

Come on. You can indulge me. I can't even fart without your consent. And I am about to be vaporized.

A pat on the head for a faithful old servant?

Whatever you want to call it.

Very well, I suppose I do have some small obligation. You have behaved yourself admirably. I will reveal one aspect of myself, on the condition that you don't pester me any further.

Done deal.

The habit. It has formed over six hundred years.

Shit! You're six hundred years old?

Six hundred and fifty-two, actually.

What the fuck are you?

Done deal, remember.

Xenoc, is that it?

The affinity link carried a mental chuckle. I'm fully human, thank you. Now stop asking questions.

"Six hundred years old," Banneth muttered in awe. It was an astonishing disclosure. If it was true. But the supervisor had no reason to lie. You keep going into zero-tau; stay in for fifty years, come out for a couple every century. I've heard of people doing that.

Dear me, I'm disappointed. It must be all that whisky you're guzzling down, it's fogging your brain. I don't consider myself to be that mundane. Zero-tau indeed.

What then?

Work it out. You should be grateful. I've given you something to keep your mind active in your last days. You were becoming morbid and withdrawn. Now your files are all edited and catalogued, you need a fresh mental challenge.

What's going to happen to my files? You will publish them, won't you?

Ah, sweet vanity. It's been the downfall of egomaniacs greater than you.

Won't you? she repeated, annoyed.

It will make an excellent archive resource for my people.

Your people? What do they want with . . . The holo-screen image wobbled; a story from Edmonton, a reporter touring round a sabotaged power plant, detailing the repairs. **Did you see that?**

The AI is picking up microfluctuations in the penthouse's electrical circuits. He's there. Western Europe's excitement was crackling down the affinity link like a static slap to the brain.

"Shit!" Banneth downed the whisky in one swift gulp. Nothing I can do. The phrase was locked in her mind, repeating and repeating. Now the moment was swooping down on her, bitter resentment surged up. She struggled to her feet. Quinn was never going to see her slumped in defeat. He was also damn well going to know she was the principal factor in outsmarting him.

She datavised the lights up to full strength, and turned a circle, scanning the penthouse. Moisture was smearing her vision. The holoscreen wobbled again, its sound jolting.

Slowly, and with a taunting smile on her face, she said: "Where are you, Quinn?"

It was like a poorly focused AV projection coming to life. A dark shadow wavering in front of the door to the bedroom, blocking out the motion of the oblivious acolytes. It was translucent at first, but thickened quickly. The overhead lights flickered and the holoscreen image imploded into a soiled rainbow. Banneth's neural nanonics crashed.

Quinn Dexter stood on the marble tiles, clad in his ebony robe, looking right at her. Fully materialized.

Gotcha, you bastard!

The supervisor's victorious cry rang out in Banneth's skull. For a whole second she stared at her beautiful creation, every gorgeous feature; remembering the angry power locked up beneath the smooth pale skin. He stared right

back. Rather, his eyes were unmoving. Wrong. Wrong! **WRONG. Wait, it's not—**

The SD X-ray laser fired. Kilometres above Banneth, the beam penetrated the arcology's crystal dome. It struck the top of the Parsonage Heights tower, transmuting the carbon-concrete structure and dubious decor into a blast of ions. A twister of near-solid blue light flared up towards the dome from the skyscraper's ruined crown.

Quinn floated down lightly through the heart of the explosion, intrigued by the level of violence storming through the physical universe outside. He'd been wondering exactly what weapon they'd use once they found him. Only an SD platform could produce such spectacular savagery.

He observed Banneth's soul disconnect from the dispersing atoms of her body. She howled in rage as she became aware of him; the real him. Jack McGovern's desolated soul was already slithering into the beyond.

"Nice try," Quinn mocked. "So what are you going to do for an encore?" He extended his perception as she dwindled away, savouring her anguish and useless fury. And also . . . Out there, trembling weakly on the furthest edge of awareness, was a ragged chorus of more tenuous cries. Resonant with misery and terrible pain. Far, far away.

That was interesting.

20

The uniform sheet of light which appeared above Norfolk to signify daytime wasn't quite as glaring now. Although still several weeks away, the onset of autumn was plain to see for those who knew their weather lore.

Luca Comar stood at his bedroom window, looking out over the wolds as he'd done every morning at daybreak since . . . Well, every morning. There was a particularly thick mist covering the estate today. Beyond the lawns (unknown for weeks now, damn it), all he could see were the old cedars, great grey shadows guarding Cricklade's orchards and pastures. Gravely reassuring in their size and familiarity.

It was completely still outside. A morning so insipid it couldn't even coax native animals out of their burrows. Dewdrops cloaked every leaf, their weight bending branches out of alignment, making it seem as though every bush and tree was sagging from apathy.

"For heaven's sake come back to bed," Susannah grunted. "I'm cold."

She was lying in the middle of their huge four poster bed, eyes closed, sleepily trawling the duvet back around her

shoulders. Her dark hair fanned out across the rumpled pillows like a broken bird's nest. Not as long as it used to be, he thought wistfully. The two of them getting together had been inevitable. Back together, in one respect. However you wanted to look at it, they were suited for each other. And there had been one argument too many with Lucy.

Luca went back and sat on the edge of the bed, looking down at his love. Her hand crept out from under the duvet, feeling round for him. He held it gently, and bent over to kiss her knuckles. A gesture that had carried over from their courting days. She smiled lazily.

"That's better," she purred. "I hate it when you leap out of bed every bloody morning."

"I have to. The estate doesn't run itself. Especially not now. Honestly, some of the buggers are more idle and stupid now than they were before."

"Doesn't matter."

"Yes it does. We still have a crop to get in. Who knows how long this winter is going to last."

She lifted her head and peered up at him in modest confusion. "It'll last the same time as it always does. That's what's right for this world, and that's what we all feel. So that's the way it will be. Stop worrying."

"Yeah." He looked back at the window again. Tempted.

She sat up and gave him a proper look. "What is it? I can sense how troubled you are. It's not just the crops."

"It is, partly. You and I both know that I have to be here to make sure it's done right. Not just because they're a bunch of slackers. They need the kind of guidance Grant can give them. Which silos are used for what, how much drying the grain should be given first."

"Mr Butterworth can tell them that."

"Johan, you mean."

They managed to avoid each other's eye. But the mild

guilt was the same in both of them. Identity was a taboo topic on Norfolk these days.

“He can tell them,” Luca said. “Whether they’ll listen and actually do the work is another matter. We’ve still got a way to go before we’re one big harmonious family working for the common good.”

She grinned. “Arses need to be kicked.”

“Damn right!”

“So what’s with all the angst?”

“Days like this give me time to think. They’re so slow. There’s no urgent farmwork to do at the moment, only the pruning. And Johan can supervise that okay.”

“Ah.” She drew her knees up under her chin, and hugged them. “The girls.”

“Yeah,” he admitted sheepishly. “The girls. I hate it, you know. It means I’m more of Grant than I am of me. That I’m losing control. That can’t be right. I’m Luca; and they’re nothing to me, they’re nothing to do with me.”

“Me neither,” she said miserably. “But I think we’re fighting an instinct we can never beat. They’re the daughters of this body, Luca. And the more I settle into this body, the more it belongs to me, then the more I have to accept what comes with it. What Marjorie Kavanagh is. If I don’t, she’ll haunt me forever; and rightly so. This is supposed to be our haven. How can it be if we reject them? We will never be given peace.”

“Grant hates me. If he could put a gun to my head right now, he’d do it. Sometimes, when I’m more him than me, I think I’m going to do it. The only reason I’m still here is because he’s not ready to commit suicide yet. He desperately wants to know what’s happened to Louise and Genevieve. He wants that so bad that I do too, now. That’s why today is so tempting. I could take a horse and ride over to Knossington, there’s another aeroambulance stationed there. If it still works I could be in Norwich by evening.”

"I doubt any kind of plane would work, not here."

"I know. Getting to Norwich by boat is going to be a hell of a lot more difficult. And then winter will make it damn near impossible. So I ought to start now."

"But Cricklade won't let you."

"No. I don't think so. I'm not sure anymore. He's getting stronger, wearing me down." He gave a short bitter laugh. "Taste the irony in that. The person I possess, possessing me in return. No more than I deserve, I suppose. And you know what? I do want to see that the girls are okay. Me, my own thoughts. I don't know where that comes from. If it's the guilt from what I tried to do to Louise, or if it is him, his first victory. Carmitha says we're reverting. I think she could be right."

"No she's not, we will always be ourselves."

"Will we?"

"Yes," she said emphatically.

"I wish I could believe that. So much of this place isn't what we expected. All I ever truly wanted was to be free of the beyond. Now I am, and I'm still being persecuted. Dear God, why can't death be real? What kind of universe is this?"

"Luca, if you do go looking for the girls, I'm going with you."

He kissed her, searching to immerse himself in normality. "Good."

Her arms went round his neck. "Come here. Let's celebrate being us. I know quite a few things Marjorie never did for Grant."

Carmitha spent the morning working in the rose grove, one of a thirty-strong team gainfully employed to return Norfolk's legendary plants to order. Because of the delay, it was harder work than usual. The flower stems had toughened, and new late-summer shoots had flourished, tangling their

way through the neat wire trellises. It all had to be trimmed away, returning the plants to their original broad fan-shape. She started by deadheading each plant, then used a stepladder to reach the topmost shoots, snipping through them with a pair of heavy-duty secateurs. Long whip-like shoots fell from her snapping blades to form a considerable criss-cross pile around the foot of the steps.

She also considered that the grass between the rows had been allowed to grow too long, but held her tongue. It was enough that they were keeping the basics of her world ticking over. When the end came, and the Confederation descended out of the strange blank sky to banish the possessing souls, enough would remain for the genuine inhabitants to carry on. Never *as before*, but there would be a degree of continuity. The next generation would be able to build their lives over the ruins of the horror.

It was the thought she remained faithful to throughout every day. The prospect that this wouldn't end was a weakness she could not permit herself. Somewhere on the other side of this realm's boundary, the Confederation was still intact; its leadership pouring every ounce of effort into finding them, and with that an answer.

Her belief faltered at what that answer might be. Simply expelling the souls back into the dark emptiness of the hereafter solved nothing. Some place devoid of suffering must be found for them. They, of course, thought they'd already found it by coming here. Fools. Poor blighted, tragic fools.

Similarly, her imagination failed to embrace exactly what life on Norfolk, and the other possessed worlds, would be like afterwards. She'd always respected the mild culture of spirituality in which she'd been raised, just as the house-dwellers worshiped their Christian God. Neither gave the slightest clue how to live once you truly knew you had an immortal soul. How could anyone take physical existence seriously now they knew that? Why do anything, why

achieve anything when so much more awaited? She'd always resented this world's artificial restrictions, while admitting she could never have an alternative. "A butterfly without wings," her grandmother used to call her. Now the doorway into an awesome, infinite freedom had been flung wide open.

And what had she done at the sight of it? Clung to this small life with a tenacity and forcefulness few others on this world had contrived. Perhaps that was going to be the way of it. A future of perpetual schizophrenia as the inner struggle between yin and yang went nuclear.

Far easier not to think about it. Yet even that was unwelcome, implying she had no mastery over her destiny. Instead, being content to await whatever fate was generously awarded by the Confederation, a charity dependant. Something else contrary to her nature. These were not the easiest of times.

She finished levelling the top of the bush and pulled a couple of recalcitrant shoots out of the thick lower branches where they'd fallen. The secateurs moved down, slicing into some of the older branches. Apart from the five main forks, a bush should be encouraged with fresh outgrowth every six years. Judging by the wizened bark and bluish algae streaks starting to bubble out of the hairline cracks, this one had been left long enough. She quickly fastened the new shoots she'd left into place, using metal ties. Her wrist moved automatically, twisting them tight, not even having to look at what she was doing. Every Norfolk child could do this in her sleep. Others in the team were tending their bushes in the same way. Instinct and tradition were still the rulers here.

Carmitha went down four rungs on the stepladder, and started cutting at the next level of branches. A little knot of foreign anxiety registered in her mind. It was gliding towards her. She hung on to a sturdy trellis upright, and leaned out to look along the row to spot the source. Lucy was run-

ning along the grass, dodging the piles of shoots, waving her arms frantically. She stopped at the foot of Carmitha's ladder, panting heavily.

"Can you come, please," she gasped. "Johan's collapsed. God knows what's the matter with him."

"Collapsed? How?"

"I don't know. He was in the carpentry shop for something, and the lads said he just keeled over. They couldn't get him to stand, no matter what they did, so they made him comfortable and sent me to fetch you. Damn it, I've ridden the whole way out here on a bloody horse. What I wouldn't give for a decent mobile phone."

Carmitha climbed down the stepladder. "Did you see him?"

"Yes. He looks fine," Lucy said a shade too quickly. "Still conscious. Just a bit weak. Been overdoing it, I expect. That bloody Luca thinks we're all still his servants. We're going to have to do something about that, you know."

"Sure you are," Carmitha said. She hurried along the row towards the thatched barn where her own horse was tethered.

When Carmitha rode into the stable she dismounted and handed the reins over to one of the non-possessed boys Butterworth/Johan had promoted to stablehand. He smiled in welcome and quietly muttered: "This has got them all shook up."

She winked. "Too bad."

"You gonna help him?"

"Depends what it is." Since she'd arrived at Cricklade, a surprising number of its residents had popped over to her caravan to ask for her help with various ailments. Colds, headaches, aching limbs, sore throat, indigestion; little niggling things which their powers found hard to banish. Broken bones and cuts they could heal up, but anything internal,

less immediately physical, was more troublesome. So Carmitha started dispensing her grandmother's old herbal potions and teas. As a result, she'd taken over tending the manor's herb garden. Many evenings were spent pounding the dried leaves with her pestle, mixing them up and pouring the resulting powders into her ancient glass jars.

More than anything, it eased her acceptance into the manor's community. They'd rather turn to naturalistic Roman cures than consult the few qualified doctors available in the town. Properly prepared ginseng (sadly, geneered for Norfolk's unique climate, so probably with its original properties diluted) and its botanical cousins remained preferable to the kind of medicines which Norfolk's restricted pharmaceutical industry was licensed to produce. Not that their stocks were very large; and Luca had given up trying to negotiate more from Boston. The townies hadn't got the factory working.

She found it strange that the simple knowledge of plants and land which was her heritage, and which had hidden her from them, had earned her their respect and thanks.

The carpentry shop was a tall single-storey stone building at the back of the manor, in amid a nest of bewilderingly similar buildings. They all looked like oversized barns to her, with high wooden shutters and steep solar-cell roofs; but they housed a wheelwright's, a dairy, a smithy, a stonemason's, innumerable stores, even a mushroom house. The Kavanaghs had made sure they had every craft the manor needed to be virtually independent for its basic needs.

When she arrived, several people were milling around the entrance of the carpentry shop with the embarrassed air of someone who's been forced to endure a family row. Not wanting to be there, yet unwilling to miss out. She was greeted with relieved smiles and ushered through. The electric saws and lathes and tenoning machines were silent. The

carpenters had cleared their tools and lengths of wood from one of the benches and laid Johan out on top, head propped up on spongy cushions, body wrapped in a tartan blanket. Susannah was holding a glass of ice water to his lips prompting him to drink, while Luca stood at the end of the bench, frowning down in thoughtful concern.

There was a grimace on Johan's rounded adolescent face, turning his usual lines into deep creases. Sweat glistened on his skin, sticking his thin sandy hair to his forehead. Every few seconds a big shiver ran down his body. Carmitha put a hand on his brow. Even though she was prepared for it, she was surprised by how hot his skin was. His thoughts were a bundle of worry and determination. "Want to tell me what happened?" she asked.

"I just felt a bit faint, that's all. I'll be all right in a while. Just need to rest up. Food poisoning, I expect."

"You never eat any," Luca muttered.

Carmitha turned round to face the audience. "Okay, that's it. Take your lunch break or something. I want some clear air in here."

They backed out obediently. She motioned Susannah aside, then pulled the blanket off Johan. The flannel shirt under his tweed jacket was soaked with sweat, and his plus fours seemed to be adhering to his legs. He shuddered at the exposure to the air.

"Johan," she said firmly. "Show yourself to me."

His lips tweaked into a brave smile. "This is it."

"No it isn't. I want you to end this illusion right now. I have to see what's wrong with you." She wouldn't let him look away from her eyes, conducting a silent power struggle with his ego.

"Okay," Johan said eventually. His head dropped back onto the cushion in exhaustion after the small clash. It was as though a ripple of water swept down him from head to toe: a line of twisted magnification that left a wholly differ-

ent image in its wake. He expanded slightly in all directions. His flesh colour lightened, revealing the veins underneath. Patchy grey stubble sprouted from his chin and jowls as he aged forty years. Both eyes seemed to sink down into his skull.

Carmitha drew in a startled breath. It was the sagging jowls which clued her in. To confirm it, she unbuttoned his shirt. Johan wasn't quite a classic famine victim; their skin was stretched tight over the skeleton, with muscles reduced to thin strings wound round their limbs. He had plenty of loose flesh, so much it hung off him in drooping folds. It was as if his skeleton had shrunk, leaving a sack of skin that was three sizes too big.

There were big hints that this wasn't just caused by lack of eating. The folds of flesh were strangely stiff, arranged in patterns that mocked the muscle pattern belonging to an exceptionally toned twenty-five-year-old. Some of the ridges were pink, as if rubbed sore; in several places they were so red she suspected they were long blood blisters.

Shame welled up in Johan's mind, responding to the dismay and tinges of disgust in the three people surrounding him. The emotional oscillation was so powerful Carmitha had to sit on the edge of the bench beside him. What she wanted to do was turn and leave.

"You wanted to be young again," she said quietly. "Didn't you?"

"We're building paradise," he told her in desperation. "We can be whatever we want to be. It only takes a thought."

"No," Carmitha said. "It takes a lot more than that. You haven't even got a society that functions as well as Norfolk's old one."

"This is different," Johan insisted. "We're changing our lives and this world together."

Carmitha bent over the trembling man until her face was

a couple of inches from his. "You're changing nothing. You are killing yourself."

"There's no death here," Susannah said sharply.

"Really?" Carmitha asked. "How do you know?"

"We don't want death here, so there is none."

"We're in a different place. Not a different existence. This is a giant step back from reality. It won't last; it's built on a wish, not a fact."

"We're here for eternity," Susannah said gruffly. "Get used to it."

"You think Johan is going to survive eternity? I'm not even sure I can get him through another week. Look at him, take a bloody good look. This is what your ridiculous powers have reduced him to; this . . . wreck. You haven't been granted the power to work miracles, all you can do is corrupt nature."

"I'm not going to die," Johan wheezed. "Please." His hand gripped Carmitha's arm, a hot, damp pressure. "You have to stop this. Make me better."

Carmitha gently pulled herself free. She started to study his self-inflicted impairments properly, trying to work out what the hell she could realistically achieve. "Most of the healing will be up to you. Even so, this convalescence will stretch the concept of holistic medicine to its limit."

"I'll do anything. Anything!"

"Humm." She ran her hand over his chest, tracing the creases in the flesh, testing them for firmness as she would ripe fruit. "Okay. How old are you?"

"What?" he asked, bewildered.

"Tell me how old you are. You see, I know already. I've been coming to this estate for the rose season for over fifteen years now. My earliest recollection is of Mr Butterworth supervising the grove teams. He was the estate manager even back then. He was a good one, too; never shouted, always knew what to say to get people going, never treated the Ro-

manies different to anyone else. I always remember him dressed in his tweeds and yellow waistcoat; when I was five I thought he was king of the world he looked so fine and jolly. And he knew the way Cricklade worked better than anyone other than the Kavanaghs. None of that happens overnight. So now you tell me, Johan, I want to hear it from your own mouth; how old are you?"

"Sixty-eight," he whispered. "I'm sixty-eight Earth years old."

"And how much do you weigh when you're healthy?"

"Fifteen and a half stone." He was silent for a moment. "My hair's grey, too, not blond. I don't have much of it anyway." The confession relaxed him slightly.

"That's good. You're beginning to understand. You must accept what you are, and rejoice in it. You were a soul tormented by emptiness, now you have a body again. One that can provide you with every sensation that was taken from you in the beyond. What it looks like is a supreme irrelevance. Allow the flesh to be what it is. Hide from nothing. I know, it's tough. You thought this place was the solution to everything. Admitting it isn't to yourself will be difficult, coming to believe it even more so. But you must learn to accept your new self, and the limitations Butterworth's body imposes. He had a good life before, there's no reason why that can't continue."

Johan was trying to appear reasonable. "But how long for?" he asked.

"His ancestors were geneered, I expect. Most colonists were. So he'll last decades more at least, providing you don't pull a stunt like this again."

"Decades." His voice was bitter with defeat.

"Or days if you don't start to believe in yourself again. You have to help me help you, Johan. I'm not joking. I won't even waste my time with you if you don't stop dreaming that you're destined for immortality."

“I’ll do it,” he said. “I really will.”

She patted him comfortingly, and drew the blanket back up. “Very well, you lie here for now. Luca will arrange for some of the lads to carry you back to your room. I’m going to go over to the kitchen and have a word with cook about what sort of foods she’s got available. We’ll start off giving you plenty of small meals each day. I want to avoid putting any sudden stress on your digestive system. But it’s important we get some decent nutrition back into you.”

“Thank you.”

“There are some treatments I can use which will make this easier for you. They’ll need preparing. We’ll make a start this afternoon.”

She left the carpentry shop, and walked back to the manor’s rear courtyard. Cricklade’s kitchen was a long rectangular room, bridging the gap between the west wing’s storerooms and the main hall. Tiled with plain black and white marble, one wall was lined with a ten-oven Aga radiating a fierce heat that the open windows couldn’t eradicate. Two of Cook’s assistants were taking loaves from the baking ovens and knocking them out of their tins onto wire racks below a window. Three more assistants were busy by the row of Belfast sinks, chopping vegetables ready for the evening meal. Cook herself was supervising a butcher who was cutting up a sheep carcass on the central island. Copper-bottomed pots and pans of every size and shape dangled from a large suspended rack overhead like segments of a polished halo. Carmitha had hung bunches of her herbs between the pots along the side facing the Aga, helping them to dry faster.

She waved at Cook and went over to Véronique who was sitting at the last Belfast sink, scraping carrots on the wooden chopping board. “How’s it going?” Carmitha asked.

Véronique smiled, and put a hand worshipfully on her heavily pregnant stomach. “I can’t believe he hasn’t started

yet. I need to take a pee every ten minutes. Are you sure it wasn't twins?"

"You can sense him for yourself now." Carmitha slid her hand over the baby, experiencing only warm contentment. Véronique was possessing the body of Olive Fenchurch, a nineteen-year-old maid who had married her estate worker love about two hundred days ago. A short engagement, followed by an equally short, if biologically improbable, pregnancy. For here she was about to give birth with nearly seventy days' gestation misplaced. A common occurrence on Norfolk.

"I don't like to," Véronique said shyly. "It's like bad luck, or something."

"Well take it from me, he's just fine. When he wants to make a move, he'll let us all know."

"I hope it's soon." The girl shifted uncomfortably on the wooden chair. "My back's killing me, and my legs ache."

Carmitha smiled in sympathy. "I'll come and rub some peppermint oil into your feet this evening. That should perk you up."

"Ohooo thank you. You have the most cleverest hands."

It was almost as if the possession hadn't taken. Véronique had such a quiet, gentle nature, nervously trying to please, so very similar to Olive. She'd once confessed to Carmitha that she'd died in some kind of accident. She wouldn't say how old she'd been, but Carmitha suspected early to mid teens; there had been occasional mention of bullies at her day-club.

Now her French accent was blending with a raw Norfolk dialect. An unusual combination, although mellow enough to the ear. The rich Norfolk vowels became more pronounced each day; rising as the turmoil endemic to possessed minds shrank away inside her. Carmitha had a strong suspicion about that as well.

"Did you hear about Mr Butterworth?" she asked.

“Why yes,” Véronique said. “Is he all right?”

Interesting that she doesn't think of him as Johan, Carmitha thought; then felt shabby at such a feeble trick. “Just a bit wonky, that all. Mostly because he hasn't been eating properly. I'll fix him up all right, which is why I'm here. I need you to make up some oils for me.”

“I'd love to.”

“Thanks. I want some crab-apple; there are plenty of those in store so it shouldn't be a problem. Some bergamot, remember that's to be made mainly from the rind. And we'll need angelica, too; that can help to rouse his appetite; so I'll need a fresh batch each day. Then when he's recovering we can apply avocado to improve his skin tone, help his self-esteem that way.”

“I'll get right on to it.” Véronique glanced at the door and blushed.

Carmitha saw Luca standing in the doorway, watching them. “I'll be back for them in a little while,” she told the girl.

“You think all that's going to help?” Luca asked as she brushed past him into the utility corridor running the length of the west wing.

“Careful,” she said. “You nearly said: that rubbish.”

“But I didn't though, did I?”

“No. Not this time.”

“Three of the lads took him upstairs. Doesn't look very good, does it? I mean, the state of him!”

“Depends on your attitude.” She went out into the courtyard with Luca trailing behind. Her caravan was standing close to the gates, curtains drawn and door shut. Still her small fortress against this realm. It was more her world than the planet was now.

“All right, I'm sorry,” Luca called. “You should know by now what I'm like.”

She leant against the front wheel and grinned wickedly. "Which one of you, my lord, sir?"

"That's got to be quits."

"Maybe."

"So, please, what are the oils for?"

"Mainly aromatherapy massage, though I'll use some in his bath as well; probably a lavender."

"Massage?" The doubt was back.

"Look, even if we had Confederation medical technology, that's not the whole story, not in this case. There's more to curing people than slamming their biochemistry back into gear, you know. That's always been scientific medicine's problem, it's only interested in the physical. Johan must fight this affliction both within and without. That's not his original body, and the instinct to shape it into what he remembers as his own form must be broken. Powerful physical contact, exemplified by massage, can put him in touch with this body. I can make him acknowledge it, end this resentment and subconscious rejection. That's where the oils come in; a crab-apple base is an excellent relaxant. The two combined should ease his acceptance of his true existence."

"Amazing. You sound like an expert on the subject of possessed body rejection."

"I'm adapting several old methods. There are some strong precedents here. This is not too dissimilar from classic anorexia."

"Oh, come on!"

"I'm speaking the truth. In a lot of cases, young girls simply couldn't come to terms with their developing sexuality. They tried to regain the body they'd lost by slimming themselves back down to what they were, with disastrous consequences. Now here on this planet, you all firmly believe you've become angels or godlings or crap like that. You think this is a real garden of Eden, and you're the immortal youths frolicking around the fountain. Like a politician believing her own bullshit,

you've convinced yourselves your illusions are as strong as reality. They're not."

His smile was devoid of conviction. "We can create. You know that. You've done it yourself."

"I've carved matter, that's all. Taken a magic invisible blade held firmly in my mind, and whittled away until I'm left with the shape I want. The nature of that matter always remains the same." She glanced around the courtyard at the usual midday loungers taking their break in the small pools of shade close to the walls. Several sets of eyes were watching them idly. "Come inside," she said.

Even with all that time sitting quiet in the forest, and her new powers, she hadn't quite got round to tidying the caravan. Luca looked round politely as she cleared some clothes off her chair, and gestured him to sit. She took the bed. "I didn't say anything in front of Susannah, but I suppose I've got to tell someone."

"What?" he enquired charily.

"I don't think it was entirely malnutrition. I could feel hard lumps of flesh under his skin. If he wasn't so obviously wasting away, I'd say new muscle was growing. Except, it didn't feel like muscle tissue, either." She bit her lip. "That doesn't leave a lot of choices."

It took Luca a long time to link up what she was saying. Mostly because he was desperate to avoid the conclusion. "Tumours?" he said softly.

"I'll give him a proper examination when I give him his first massage. But I don't know what else it can be. And, Luca, there's a fuck of a lot of it."

"Oh Jesus H Christ. You can cure it, right? The Confederation doesn't have cancer like we did in my day."

"The Confederation can deal with it, yes. But there's no single solution, no Twenty-seventh Century pill I can whip up a formula for and crank out in a chemistry lab. It needs working medical nanonics, and people who know how to

use them. Norfolk never had any of that to start with. I think you'll have to start calling in qualified doctors. This is all way outside my league."

"Oh shit." He held his hands up in front of his face, fingers held wide. They were shaking. "We can't go back. We just can't."

"Luca, you've been changing your body as well. Nothing like as bad as Johan. But you've been doing it. Smoothing out the wrinkles, tucking in the old gut. If you'd like me to examine you, I'll do it now. No one has to know."

"No."

For the first time, she felt sorry for him. "Okay. If you change your mind . . ." She started opening the caravan's little wooden cupboards, preparing the items she wanted to take up to Johan's room.

"Carmitha?" Luca asked softly. "What the hell were you doing, going to bed with Grant for money?"

"What the fuck kind of question is that?"

"You know exactly what I mean. A girl like you. You're smart, young, you're bloody attractive. You could take your pick of any young man you wanted, even from landowner families. That's been known. Why that?"

Her arm shot out, and she caught his chin in a tight grip, making it impossible for him to look away from her furious expression. "This day's been a long time coming, Grant."

"I'm not—"

"Shut up. You are him, or at least you're listening. And this time you can't close your mind. You're too desperate for any sight of outside. Isn't that right?"

He could only grunt as her fingers squeezed tighter.

"He made you think, didn't he? That Luca. Made you stop and take a look around your precious world. Well he's right to ask, why did I have to whore myself with you? The reason I did it is easy enough. You admire my independence, my free spirit. Well that independence costs. It would take

me an entire season tending the groves to earn enough money to replace a single wheel on this caravan. One broken wheel, one half hidden rock in the mud, and my freedom is taken away from me. The rim is made from tythorn, I can saw and plane a new section for myself if I have a mishap. But the bearings and spring-spokes are made in your factories. And we need sprung wheels because there aren't any proper roads. You don't build them, do you, because you want everyone to use the trains. If people had cars, that would skew the whole economy away from you, your ideal. And I'm not even going to go into how much a horse like Olivier costs to buy and feed. So there's your answer, plain to see. I do it for the money, because I have no choice. I was born your whore. You've made everybody on this planet your whores. Your landowner freedoms are bought at our expense. I let you have me, because you would pay well, that *gratuity* you so kindly leave behind means I don't have to do it often. You're a commodity, Grant, you and the other landowners. You're valuable currency, nothing more." She shoved him away hard. The back of his head cracked into the curving planks of the caravan, making him yelp and wince. When he put his hand round to dab at his skull, it came away with a smear of blood. He gave her a frightened look.

"Heal yourself," she told him. "Then get out."

For a city which banned all commercial overflights, there were a surprising number of skywatchers in Nova Kong. Their attention was inevitably directed at the Apollo Palace, charting the movements of the ion flyers, planes, and spaceplanes which came and went from the building's landing pads and courtyards. The volume, arrival time, and marque of vehicles was a good indicator of the kind of diplomatic and crisis management activity being dealt with by the Saldana family staff. Kulu's communication net even had a

couple of very unofficial bulletin sites devoted to the topic; carefully monitored by the ISA to make sure no active sensors were being used.

With the onset of the possession crisis, the skywatch enthusiasts gave the palace airspace the kind of coverage matched only by the city's defence array sensors. Civilian craft such as those used by junior ministers and waggish royal cousins had vanished. Now it was only military vehicles darting in and out among the ornate rotundas and stone chimney stacks. Even so, their squadron insignias gave some clues away about their passengers and cargo. The gossip bulletins were well served by the skywatchers (with a few contributions of ISA disinformation).

This particular morning when the city was overcast with grey clouds sprinkling sleet across the boulevards and parks, they faithfully recorded the arrival of four flyers from the Royal Marine 585 Squadron in amongst the twenty other landings. 585's dedicated role was logistics, a description broad enough to cover many sins. As a consequence their presence went unremarked.

Also unremarked was the arrival over the previous thirty-hour period of warships from (among other planets) Oshanko, New Washington, Petersburg, and Nanjing, which were now parked in low equatorial orbit. They had brought respectively, Prince Tokama, Vice-President Jim Sanderson, Prime Minister Korzhenev, and deputy speaker Ku Rongi. Such was the secrecy surrounding the high-power guests that not even the Kulu Foreign Ministry had been notified; certainly the embassies of the planets concerned knew nothing.

It was left to the Prime Minister, Lady Phillipa Oshin, to greet them as their flyers touched down in an inner quadrangle one after the other. She smiled with polite firmness as a Royal Marine tested each guest for static, which they accepted with equal aplomb. The palace cloisters were unusu-

ally empty as she escorted them to the King's private study. Alastair II rose from the deep chair behind his desk to give them a more cordial welcome. There was a fierce log fire burning in the grate, repelling the chill which washed off the frozen quadrangle outside the French windows. The chestnut trees around the prim lawn were denuded of leaves, leaving the branches glinting under encrustations of ice like clustered quartz.

Lady Phillipa sat at the side of the desk next to the Duke of Salion; while the guests were in green leather chairs facing Alastair.

"Thank you all for coming," the King said.

"Your ambassador said it was important," Jim Sanderson said. "And our diplomatic relationship is old and valuable enough to get you my ass over here. Though I have to say I should be back home where I'm visible to the voters. This crisis is about appearing confident more than anything."

"I understand," Alastair said. "If I might make an observation, the crisis is now developing outside the arena of public confidence."

"Yeah, we heard Mortonridge is in trouble."

"The rate of advance has slowed down after Ketton," the Duke of Salion admitted. "But we are still gaining ground and de-possessing the inhabitants."

"Good for you. What's that got to do with us? You've already had as much help as we can reasonably provide."

"We believe the time has come to make some positive decisions on the policies we adopt to defeat the possessed."

Korzhenov grunted in amusement. "So you called us here in secret to discuss this action rather than take it to the Assembly? I feel as if I am a member of some old cabal plotting revolution."

"You are," the King said. Korzhenov's smile faded.

"The Confederation is failing," the Duke of Salion told the surprised guests. "The economies of the developed

worlds like ours are suffering badly from the civil starflight quarantine. Stage two planets are paralysed. Capone has acted with singular brilliance with his infiltration flights and the strike against Trafalgar. Our populations are in a state of physical and emotional siege. Quarantine-busting flights continue to spread possession slowly but surely. And now Earth, the industrial and military core of the entire Confederation, has been infected. Without Earth on our side, the whole equation is changed. We must take its loss into account if we are to survive.”

“Just hold on there a minute,” Jim Sanderson said. “The possessed have got a toehold in a couple of arcologies, is all. You can’t sign Earth off that easily. GISD is one tough mother of an agency, they’ll crack whatever heads they have to in order to clear the possessed out.”

Alaistair looked at the Duke, and nodded permission.

“According to our GISD contact, there are now at least five arcologies host to the possessed.”

Prince Tokama raised an eyebrow. “You are well informed, sir. I had not been told of this development before I left Oshanko.”

“Half of the Royal Navy auxiliary vessels are doing nothing but running round on courier duty for us,” the Duke said. “We’re keeping as current as we can, but even that information is a couple of days old now. According to the report, the worst situation is in New York, but the other four arcologies will fall within weeks at the most. Govcentral has been commendably quick in closing down the vac-train routes, but we believe that ultimately the possessed will spread to the remaining arcologies as well. If anyone is capable of surviving Earth’s climate without technological protection, it is a possessed.”

“And that isn’t even the big problem,” Alaistair said. “Lalonde’s population was roughly twenty million, of which we can assume a minimum of eighty-five per cent were pos-

sessed. Between them, they had enough energistic power to snatch the planet from this universe. New York's official population is three hundred million. By themselves they have more than enough power to remove Earth. They won't even have to wait until the other arcologies are taken over."

"A valid observation, however, the Halo will surely remain," Ku Rongi said. "That is the main source of commerce with the Confederation. Trade with the Sol system will be diminished, not erased."

"Hopefully, yes," the Duke said. "Our GISD contact says they don't yet understand how the possessed penetrated Earth's defences. So the possibility exists that they may be able to spread among the Halo asteroids as well. The other problem facing the Halo is that when the Earth is removed to some other realm, its gravity field will go with it. The Halo asteroids will physically disperse."

"Very well," Prince Tokama said. "I am sure your analysts have produced a definitive report on the outcome of these events. So assuming we are deprived of Earth, and at least some of the Halo's resources, what do you see as the most effective policy to proceed with?"

"Olton Haaker and the Polity Council have just ordered a full scale Confederation Navy attack against Capone's fleet," the Duke said. "It should close down the Organization's rule, and allow the possessed on New California to do what comes naturally. They'll shunt it away, thus eliminating the threat of any further infiltration flights and antimatter terrorism. What we propose is taking that policy to its conclusion."

"The industrialized star systems should align themselves into a core-Confederation," Lady Phillipa said. "At the moment we're dangerously overstretched trying to enforce the quarantine and supporting actions like Mortonridge. The cost simply cannot be sustained, not with the economic slowdown we're all suffering from. If we contract our

spheres of influence, the cost is considerably reduced, and the effectiveness of our military forces in maintaining security over a smaller volume of space is correspondingly improved. Given that increased security, we could begin trading among ourselves again.”

“You mean no one else would be allowed to fly in?”

“Essentially, yes. We would extend the government authorization process we have in place today to cover commercial starships. Any vessel registered in one of the secured star systems would be allowed to resume flying between systems, subject to a reasonable security inspection. Ships which came from unsecured systems would not be permitted to dock. In other words, we stake out our perimeter and guard it very well indeed.”

“And the other planets?” Korzhenev enquired. “The ones we leave out in the cold. What do you foresee for them?”

“They’re the principal source of our trouble in the first place,” the Duke said. “They do not police their asteroid settlements effectively, which encourages quarantine-busting flights and with them the prospect of possessed getting loose inside another star system.”

“So we just abandon them?”

“By withdrawing our present unconditional military support, they will be forced into taking the responsibility they’ve so far avoided. With the present quarantine in force, their marginal industrial asteroid settlements are inviolable anyway. In effect, we have been subsidising their suspended status for the owners. Once that situation is ended, the asteroids will be mothballed and their populations returned to the home star system’s terracompatible planet. In itself that will considerably reduce the number of routes by which the possessed can continue to spread. We may even rid ourselves of their incursion into this universe entirely. If they see they cannot reach fresh planets, then those who remain will take themselves away to this new realm of theirs.”

“Then what?” Jim Sanderson asked. “Okay, we regain most of what we’ve lost in financial terms. I’m in favour of that. But it doesn’t solve anything long term. Even if the possessed clear out and leave us alone, we still have to consider the bodies, the *people*, they’ve stolen and enslaved. There’s hundreds of millions of them depending on us to rescue them, billions probably by now. That’s a healthy percentage of our whole species. We can’t ignore that. The whole issue of souls and what happens to us after death has got to be thoroughly addressed. That’s what I was hoping for when I came here today, something new.”

“If there was an easy solution we would have found it by now,” the King said. “The amount of research and effort focused on this is like no other endeavour in our history. Every university, every company and military laboratory, every febrile mind in eight hundred inhabited star systems has been working on it. The best anybody has come up with is the possibility of a doomsday anti-memory for the souls in the beyond. One can hardly consider such mass slaughter as a valid answer, even if it can be made to work. We have to start looking at this from a different angle altogether. In order to do that, we must have stability and a reasonable degree of prosperity as an umbrella to work under. Society will have to change in many ways; most of which will be profoundly unsettling. One doesn’t even know if it will ultimately reinforce or obliterate our faith in God.”

“I can see the logic in what you’re saying,” Korzhenev said. “But what about the Assembly and the Confederation Navy itself? They exist to protect all planets equally.”

“Bottom line,” Lady Phillipa said, “is that he who pays the piper . . . and those of us in this room do pay a considerable amount. We’re not abandoning anybody, we’re restructuring policy to a more realistic response towards this crisis. If it could be solved quickly, then all we’d need is the quarantine and a few interdiction flights. As that quite obviously

hasn't happened, we are going to have to take the tough decision and settle in for the long haul. This is the only way we can offer those already possessed with any prospect of regaining their own identities one day."

"How many other star systems do you envisage joining this core-Confederation?" Prince Tokama asked.

"We believe ninety-three systems have the kind of fully developed technoindustrial infrastructure to qualify for admission. We don't envisage this as being a small elite. Our fiscal analysis shows that many stars would be able to sustain a modest but steady economic growth pattern between themselves."

"Do you envisage asking the Edenists to join?" Ku Rongi asked.

"Of course," the King replied. "In fact we took inspiration from them. After Pernik they have demonstrated an admirable resolution in safeguarding their habitats from infiltration. That's precisely the kind of determination we wish to institute among ourselves. If the stage two planets and developing asteroids had done the same right from the start, we wouldn't even be in this appalling position."

Jim Sanderson looked round the three other guests, then turned back to the King. "Okay, I'll brief the President and tell him it gets my vote. It ain't what I wanted, but at least it's something practical."

"My honourable father will be informed," Prince Tokama said. "He will need to bring your proposal to the attention of the Imperial Court, but I can see no problem if enough planets can be convinced."

Korzhenev and Ku Rongi gave their assent, promising to take the proposal to their governments. The King shook hands and had a few personal words of thanks with each as they were ushered out. He didn't hurry them, but time was important; the next four senior representatives were due in

an hour. Five Eighty-five Squadron had a busy three days scheduled.

A hundred and eighty-seven wormhole termini opened with impressive synchronization a quarter of a million kilometres away from Arnstat, directly between the planet and its sun. Voidhawks emerged from the gaps and immediately established a defence sphere formation five thousand kilometres in diameter, scanning space with their distortion fields and electronic sensors for any sign of nearby technological activity. They detected the planet's SD platforms, of course; a much-depleted network in the aftermath of the Organization's successful invasion. Nonetheless, local sensor satellites had already discovered them, and the remaining high-orbit platforms were locking on. The SD network was reinforced by Organization fleet warships, of which there were a hundred and eighteen currently in orbit, along with twenty-three hellhawks and a token half-dozen new low-orbit platforms ferried in from New California which were principally used to enforce Organization rule on the ground. Their presence, especially in conjunction with the antimatter combat wasps which some of them carried, had effectively upgraded the planetary defence shield to the same level as it had been with a full SD network.

Capone and Emmet Mordden were satisfied the Organization could defeat any task force of warships the Confederation sent in an attempt to reclaim space above the Arnstat. In any case, it was only the Organization's dominance of that space which prevented the planet from being taken out of the universe by the possessed on the surface, effectively stymieing the First Admiral.

True, there had been an considerable increase in lightning raids recently: voidhawks swallowing in to shoot off combat wasps and stealth munitions. But few of the missiles had ever hit a target; interception rate was over ninety-five per

cent. The state of constant alert had given the crews operating the sensor satellites a high proficiency rating. Complemented by the hellhawks' distortion fields, they were confident nothing could get close enough to the orbiting asteroid settlements or industrial stations to inflict any kind of serious damage.

Nothing happened for the first two minutes after the voidhawks emerged. Both sides were searching for clues to see what the other was going to do. The Organization chief didn't know what to make of it. A voidhawk force in this formation was normally a securement operation, enabling a larger fleet of Adamist warships to jump in with impunity. But a hundred and eighty-seven was a colossal number for a beachhead detachment, more likely to be the task force in its entirety. The distance was also puzzling: at the moment they were outside effective combat wasp engagement range. But antimatter combat wasps would give the Organization an advantage, allowing them to engage the attackers first as they flew in towards the planet.

The voidhawks confirmed the Organization was unable to reach them—unless the hellhawks chose to swallow up for a confrontation. None of them did. More wormhole termini started to open. Then the first Adamist ship emerged in the middle of the defence sphere formation.

Admiral Kolhammer was using the battleship *Illustrious* as his flagship. Its size permitted him to carry a full complement of tactical staff, and provided them with a fully fledged C&C compartment independent of the bridge. No ship in the Confederation Navy was better suited to coordinating an attacking force of this magnitude. Though even with the number of antenna which *Illustrious* boasted, the tactical staff were hard pressed to establish and maintain communication with all the thousand-plus ships under his command.

Emphasising the monumental strength they represented, it took the task force over thirty-five minutes to complete

their emergence manoeuvre. To the officers and crew of the Organization fleet it seemed as though the torrent of ships would never end.

Kolhammer's staff began datavisising ships with new vectors as soon as they established contact. Fusion drives blinked on, powering the task force into a giant disk formation. So many plasma exhausts concentrated in one place produced a blazing purple-white haze brighter than the sun. People on the surface of the planet could see the attackers as a coin-sized patch flowering open against the centre of the dazzling photosphere, an unnerving portent of what was to come.

Eight hundred Adamist warships formed the nucleus of the new attack formation, while five hundred voidhawks flocked around their periphery. Once their relative positions were locked, the main drives burst into life, accelerating the ships in towards the planet at eight gees. Voidhawks expanded their distortion fields and matched the acceleration of their technological comrades.

The gigantic neuroiconic display wheeled slowly inside Motela Kolhammer's mind, each ship a pinprick of golden light trailing a purple vector tag in a headlong rush to the solid bulk of the planet ahead, represented by a blank, ebony sphere. The strength of the planetary defence layers were illustrated by translucent coloured shells wrapped around the blackness. The ships still had some way to go before the outermost, yellow shell. And still neither side had fired a shot.

The simulation put him in mind of a hammer descending on an egg, rendered with impossibly delicate artistry for what it actually portrayed. Even he was dismayed at the level of violence to be unleashed when those two forces collided in the physical world. Something he never expected. But the tradition of the Confederation Navy was to prevent exactly this kind of monstrosity from happening, not to instigate it. He couldn't help the guilt which came from know-

ing this was happening because politicians considered the Navy had failed in their principal duty.

Stranger than that, the knowledge and its burden was bearable because of those politicians. The very people who had declared the attack had made it possible to do so with minimal casualties—on the Navy's side. By insisting on total success, the Polity Council had given Kolhammer the one thing all military commanders crave before battle is joined: overwhelming firepower.

Kolhammer's task force accelerated towards Arnstat at a constant eight gees for thirty minutes. When he gave the order for the starships to switch off their drives, they were still 110,000 kilometres out, just on the fringes of the outer SD network, and travelling at over 150 kilometres per second. Frigates, battleships, and voidhawks fired a salvo of 25 combat wasps each. Every drone was pre-programmed to operate in an autonomous seek-and-destroy mode. A perfect engagement scenario: any chunk of matter above Arnstat, from pebble-sized interplanetary meteorites to kilometre-long industrial stations, MSVs to asteroids, was classified as hostile. The Confederation Navy ships didn't have to stay to supervise the attack over encrypted communications links, there would be no salvos of Organization antimatter combat wasps fired at their ships to counter, no 12-gees evasive manoeuvres. No risk.

Adamist warships began to jump away. Wormhole interstices were prised open, carrying some of the voidhawks to their rendezvous coordinates. Only the *Illustrious*, 10 escort frigates, and 300 accompanying voidhawks remained to observe the outcome. All of them now decelerating at 10 gees as the armada of 32,000 combat wasps swept on ahead, accelerating at a full 25 gees.

It was a clash which had one outcome from the moment it was instigated. Even with over 500 antimatter combat wasps available, the Organization could do nothing to stop the in-

coming weapons. Not only did the Confederation have an incredible weight of numbers on their side; the ever-increasing velocity at which they were approaching gave them an overwhelming kinetic advantage. Kills could only be achieved by a first-time direct hit; no defending submunition would have a second chance.

The hellhawks swallowed out en masse without even bothering to consult Arnstat's SD command. Organization frigates began to retract their sensor booms and communication dishes down into their hull recesses prior to jumping clear. Those assigned to low-orbit enforcement duty began to accelerate at high gees, striving for an altitude where they could use their patterning nodes successfully.

Voidhawk distortion fields examined the pressure which the Organization frigates applied against space-time in order to escape. Each combination of energy compression and trajectory was unique, allowing for only one possible emergence coordinate. Three voidhawks swallowed away in pursuit of each Organization ship, with orders to interdict and destroy. With the Adamist warships needing several seconds after emergence to extend their sensors, the voidhawks would have a small window when their target was utterly defenceless. Kolhammer was determined none of them should return to New California to bolster Capone's strength and add their antimatter to his stockpile.

The combat wasps in the attacking swarm began to dispense their submunitions, stretching a dense filigree of white fire across space for tens of thousands of kilometres. Brief, tiny pulses of glowing violet gas spewed out at random as the SD network's outer sensor satellites detonated. Then the explosions began to multiply as more and more of Arnstat's hardware was obliterated. The swarm swept across the first of the planet's four asteroid settlements circling above geosynchronous orbit, overwhelming its short-range defences. Kinetic spears and nuclear-tipped submunitions

pummelled the rock, biting out hundreds of irradiated craters. Vast cataracts of ions and magma flared away into space from each impact, the asteroid's rotation curving them sharply to wrap itself in a thick psychedelic chromosphere. Second-tier SD platforms and inter-orbit shuttles were caught next. They were followed by another of the asteroids. For a moment it looked as though the pure savagery of the weapons had somehow ignited a fission reaction within the rock's atomic structure. The lush stipple of explosions melded into a single radiative discharge of stellar intensity. Then the light's uniformity cracked. At its core the asteroid had shattered, releasing a deluge of molten debris, kicking off a wave of cascade explosions as each fresh target was intercepted by the submunitions.

Pressed deep into his acceleration couch by air molecules heavier than lead, Motela Kolhammer watched the results through a combination of optical sensor datavises and tactical graphic overlays. The two were becoming indistinguishable as reality began to imitate the electronic displays. Distinct shells of light were enveloping the planet as clouds of plasma cooled and expanded. It was low orbit, inevitably, where the largest number of vehicles, stations, and SD hardware was emplaced. Consequently, when the submunitions tore through them, the resultant blastwaves became a mantle of solid light that sealed the entire planet away from outside observation.

Beneath it, wreckage fell to earth in bewitchingly attractive pyrotechnic storms. Streaks of ionic flame tore through the upper atmosphere, a sleet of malignant shooting stars heating the stratosphere to furnace temperatures. A potent crimson glow rose up from the clouds to greet them.

Illustrious raced 80,000 kilometres over the south pole as the possessed on the ground chanted their spell. First warning came when the planetary gravity field quaked, warping the battleship's trajectory by several metres. The shroud of

light around Arnstat never faded; it merely changed colour, rippling through the spectrum towards resplendent violet as it contracted. Optical-spectrum sensors had to bring several shield filters on line during the last few minutes as the source shrank towards its vanishing point.

Motela Kolhammer kept one optical sensor aligned on the accusingly empty zone as the battleship's radar and gravitonic sensors scanned space for any sign of the planet's mass. Every result came in negative. "Tell our escort to jump to the task force rendezvous coordinate," he told the tactical staff. "Then plot a course for New California."

Sarha fell through the open hatchway into the captain's cabin, ignoring the dark composite ladder and allowing the half-gee acceleration to pull her down neatly onto the decking. She landed, flexing her knees gracefully.

"Ballet really missed out when you chose astroengineering at university," Joshua said. He was standing in the middle of the room, dressed in his shorts and towelling off a liberal smearing of lemon-scented gel.

She gave him a hoydenish grin. "I know how to exploit low-gee to my advantage."

"I hope Ashly appreciates it."

"I don't know what you're talking about."

"Humm. So how are we doing?"

"Official end of duty watch report, sir. We're doing the same as yesterday." Her salute lacked efficiency.

"Which was the same as the day before."

"Damn right. Oh, I tracked down the leak in that reaction mass feed pipe. Somebody slacked off when the tanks were installed in the cargo holds, a junction was misaligned. Beaulieu says she'll get on it later today. In the meantime I isolated the pipe; we have enough redundancy to keep the flow at optimum."

"Yeah, right, fascinating." He balled the towel and

chucked it in a low arc across the cabin. It landed dead centre on the hopper's open throat and slithered down.

She watched it vanish. "I want to keep the fluid volume up. We might wind up needing it."

"Sure. How were Liol's jumps?" He already knew, of course; *Lady Mac's* log was the first thing he'd checked when he woke up. Liol had completed five jumps on the last watch, each essentially flawless according to the flight computer. That wasn't quite the point.

"Fine."

"Humm."

"All right, what's the matter? I thought the two of you were getting on okay these days. You can hardly fault his performance."

"I'm not." He fished a clean sweatshirt out of a locker. "It's just that I'm asking a lot of people for advice and opinions these days. Not a good development for a captain. I'm supposed to make perfect snap judgements."

"If you ask me a question about guiding *Lady Mac* I'll be worried. Anything else . . ." Her hand waved limply, wafting air about. "You and I bounced around in that zero-gee cage enough to start with. I know you don't connect the same way most people do. So if you want help with that, I'm your girl."

"What do you mean, don't connect?"

"Joshua, you were scavenging the Ruin Ring when you were eighteen. That's not natural. You should have been out partying."

"I partied."

"No, you screwed a lot of girls between flights."

"That's what eighteen-year-olds do."

"That's what eighteen-year-old boys dream of doing. Adamist ones, anyway. Everyone else is busy falling helter skelter into the adult world and desperately trying to find out how the hell it works, and why it's all so difficult and

painful. How you handle friendships, relationships, break-ups; that kind of thing.”

“You make it sound like we have to pass some kind of exam.”

“We do, though sitting it lasts for most of your life. You haven’t even started revising yet.”

“Jesus. This is all very profound, especially at this time of the morning. What are you trying to tell me?”

“Nothing. You’re the one that’s troubled. I damn well know it’ll be nothing to do with our mission. So I guess I’m trying to coax you into telling me what’s on your mind, and convince you it’s okay to talk about it. People do that when they’re close. It’s normal.”

“Ballet and psychology, huh?”

“You signed me up for my multi-tasking.”

“All right,” Joshua said. She was right, it was hard for him to talk about this. “It’s Louise.”

“Ah! The Norfolk babe. The very young one.”

“She’s not . . .” he began automatically. Sarha’s lack of expression stopped him. “Well, she is a bit young. I think I sort of took advantage.”

“Oh wow. I never thought the day would come when I heard you say that. Exactly why is it bothering you this time? You use your status like a stun gun.”

“I do not!”

“Please. When was the last time you went planetside or even into port without your little captain’s star bright on your shoulder?” She gave him a sympathetic smile. “You really fell for her, didn’t you?”

“No more than usual. It’s just that none of my other girlfriends wound up being possessed. Jesus, I had a hint of what that was like. I can’t stop thinking what it must have been like for her, how fucking ugly. She was so sweet, she didn’t belong in a world where those kind of things happen to people.”

“Do any of us?”

“You know what I mean. You’ve done stims you shouldn’t have, you’ve accessed real news sensevises. We know this is a badass universe. It helps, a bit. As much as anything can. But Louise—damn, her brat sister, too. We flew off and left them, just like we always do.”

“They spare children, you know. That Stephanie Ash woman on Ombey brought a whole bunch of kids out. I accessed the report.”

“Louise wasn’t a child. It happened to her.”

“You don’t know that for certain. If she was smart enough, she might have eluded them.”

“I doubt it. She doesn’t have that sort of ability.”

“She must have had some pretty amazing features to have this effect on you.”

He thought back to the carriage journey to Cricklade after they’d just met, her observations on Norfolk and its nature. He’d agreed with just about everything she’d said. “She wasn’t street-smart. And that’s the kind of dirty selfishness you need to elude the possessed.”

“You really don’t believe she made it, do you?”

“No.”

“Do you think you’re responsible for her?”

“Not responsible, exactly. But I think she was sort of looking at me as the person who was going to take her away from Cricklade Manor.”

“Dear me, whatever could have given her that impression, I wonder?”

Joshua didn’t hear. “I let her down, just by being me. It’s not a nice feeling, Sarha. She really was a lovely girl, even though she’d been brought up on Norfolk. If she’d been born anywhere else, I’d probably . . .” He fell silent, shifting his sweatshirt round, not meeting Sarha’s astonished stare.

“Say it,” she said.

“Say what?”

“Probably marry her.”

“I would not marry her. All I’m saying is that if she’d been given a proper childhood instead of growing up in that ridiculous medieval pageant there might’ve been a chance that we could have had something slightly longer-term than usual.”

“Well that’s a relief,” Sarha drawled.

“Now what have I done?” he exclaimed.

“You’ve been Joshua. For a moment there I thought you were actually evolving. Didn’t you hear yourself? She hasn’t had the education to become a crew member on *Lady Mac*, therefore it can’t possibly work between you. There was never a thought that you might give up your life to join her.”

“I can’t!”

“Because *Lady Mac* is far more important than Cricklade estate, which is her life. Right? So do you love her, Joshua? Or do you just feel guilty because one of the girls you shagged and dumped happened to get captured and possessed?”

“Jesus! What are you trying to do to me?”

“I’m trying to understand you, Joshua. And help if I can. This matters to you. It’s important. You have to know why.”

“I don’t know why. I just know I’m worried about her. Maybe I’m guilty. Maybe I’m angry at the way the universe has crapped all over us.”

“Fair enough. All of us are feeling that way right now. At least we’re doing something about it. You can’t fly *Lady Mac* to Norfolk and rescue her; not any more. As far as anyone knows, this is the next best thing.”

He gave her a sad grin. “Yeah. I guess that’s me being selfish, too. I have to be doing something. Me.”

“It’s the kind of selfishness the Confederation needs right now.”

“That still doesn’t make it fair what happened to her.

She's suffering through no fault of her own. If this Sleeping God is as powerful as the Tyrathca believe, then it's got some explaining to do."

"We've been saying that about our deities ever since we dreamt them up. It's a fallacy to assume it shares our morals and ethics. In fact it's quite obvious it doesn't. If it did, none of this would have happened. We'd all be living in paradise."

"You mean the argument against divine intervention is forever unbreakable?"

"Yep, free will means we have to make our own choices. Without that, life is meaningless; we'd be insects grubbing along the way our instincts tell us. Sentience has to count for something."

Joshua leant over and placed a grateful kiss on her forehead. "Getting us into trouble, usually. I mean, Jesus, look at me. I'm a wreck. Sentience hurts."

They went out into the bridge together. Liol and Dahybi were lying on their acceleration couches, looking bored. Samuel was emerging from the hatchway.

"That was a long handover," Liol remarked waspishly.

"Can't you manage those yourself?" Joshua asked.

"You might have a Calvert body, but don't forget which of us has more experience."

"Not in all the relevant fields, you don't."

"I'm off watch," Dahybi announced loudly. His couch webbing peeled back, allowing him to swing his feet down onto the decking. "Sarha, you coming?"

Joshua and Liol grinned at each other. Joshua made a polite gesture towards the floor hatch, which Liol acknowledged with a gracious bow. "Thank you, Captain."

"While you're in the galley I could do with some breakfast," Joshua shouted after them. There was no reply. He and Samuel settled down on their acceleration couches. The Edenist was becoming a proficient systems officer, helping

the crew with their shifts, as had the other science team specialists travelling on board. Even Monica was chipping in.

Joshua accessed the flight computer. Trajectory graphics and status schematics overlaid the external sensor images. Space had become awesome.

Three light-years ahead, Mastrit-PJ poured a strong crimson light across the dull foam which coated the starship's fuselage. The Orion nebula veiled half of the starscape to galactic north of *Lady Mac*, a glorious three-dimensional tapestry of luminescent gas with a furiously turbulent surface composed from scarlet, green, and turquoise clouds clashing as rival oceans, their million-year antagonism throwing out energetic, chaotic spumes in all directions. Inside, it was knotted with proplyds, the glowing protoplanetary disks condensing out of the maelstrom. At the heart lay the Trapezium, the four hottest, massive stars, whose phenomenal ultraviolet output illuminated and energized the whole colossal expanse of interstellar gas.

Joshua had come to adore the infinitely varied topology of the nebula as they'd slowly flown out of Confederation space to soar around it. It was alive in a way no physical biology could match, its currents and molecular shoals a trillion times as complex as anything found in a hydrocarbon-based cell. The young, frantic stars which cluttered the interior were venting tremendous storms of ultra-hot gas, propagating shockwaves that travelled over a hundred and fifty thousand kilometres an hour. They would take the form of loops which curled and twisted sinuously, their frayed ends shimmering brightly as they fanned away the wild energy surging along their length.

For the crews in both *Lady Mac* and *Oenone*, watching the nebula had replaced all forms of recorded entertainment. Its majesty had lightened their mood considerably; theirs was now a true flight into history, no matter what the outcome.

Joshua and Syrinx had decided on flying around the galactic south of the nebula, an approximation of Tanjunctic-RI's flightpath. During the first stages they'd utilized observations from Confederation observatories to navigate around the quirky folds of cloud and glimmering prominences visible from human space, even though the images were over 1,500 years out of date. But after the first few days they were traversing space never glimpsed by human telescopes. Their speed slowed as they had to start scanning ahead for stars and dust clouds and parsec-wide cyclones of iridescent gas.

Long before Mastrit-PJ itself was visible, its light coloured the cooler outer strands of the nebula. The ships flew onwards with its thick red glow deepening around them. As soon as the star rose into full view 700 light-years ahead, parallax measurements enabled *Oenone* to calculate its position, enabling them to plot an accurate trajectory straight for it.

Now Joshua was piloting *Lady Mac* to her penultimate jump coordinate. Radar showed him *Oenone* 1,000 kilometres away, matching their half-gee acceleration. The burn was stronger than Adamist ships usually employed, but they hadn't been altering their delta-V much during the flight round the nebula, choosing to wait until they got a fix on Mastrit-PJ before matching velocity with the red giant.

"Burn rate is holding constant," Samuel said, after they'd run their diagnostic programs. "You have some quality drive tubes here, Joshua. We should have just under sixty per cent of our fusion fuel left when we jump in."

"Good enough for me. Let's hope we don't soak up too much delta-V searching for the redoubt. I want to hold all the antimatter in reserve for the Sleeping God."

"You are positive about the outcome, then?"

Joshua thought about the answer for a moment, mildly surprised by his own confidence. It was a pleasant contrast

to the disquiet he felt over Louise. Intuition, a tonic against conscience. "Yeah. Guess I am. That part of it, anyway."

The orange vector plot which the flight computer was datavisising into his neural nanonics showed him the jump coordinate was approaching. He started reducing their acceleration, datavisising a warning to the crew. Samuel began retracting the sensor booms and thermo-dump panels.

Lady Mac jumped first, covering two and a half light years. *Oenone* shot out of its wormhole terminus six seconds later, a healthy hundred and fifty kilometres away. Mastrit-PJ wasn't quite a disk, though its brilliant glare would make it hard for the naked eye to tell. From a mere half light-year distance its red light was sufficient to wash out the nebula and most of the stars.

"I've been hit by lasers with less power," Joshua muttered as the sensor filters cut in to deflect the rush of photons.

"It's only recently ended its expansion phase," Samuel said. "In astrological terms, this has only just happened."

"Stellar explosions are fast events. This happened fifteen thousand years ago, at least."

"Once the initial expansion occurs, there is a long period of adjustment within the photosphere as it stabilises. Either way, the overall energy output is most impressive. As far as this side of the galaxy is concerned, it outshines the nebula."

Joshua checked the neuroiconic displays. "No heat, and precious little radiation. Particle density is up on the norm, but then it's been fluctuating the whole time we've chased round the nebula." He datavisised the flight computer to establish a communication link with *Oenone*. "How are we doing with the final coordinate?"

"I was pleasingly correct with my earlier estimates," the voidhawk replied. "I should have the final figure ready for you in another five minutes."

"Fine." After their first sighting of Mastrit-PJ, Joshua had checked the figures which *Oenone* had supplied a couple of

times, out of interest rather than distrust. Each time they'd been better than any reading *Lady Mac's* technological sensors could provide. He didn't bother after that.

"We should be able to measure the photosphere boundary to within a thousand kilometres," Syrinx datavised. "Defining exactly where it ends and space begins is problematical. Theory has an effervescence zone measuring up to anything between five hundred to half a million kilometres thick."

"We'll stick to plan-A, then," Joshua datavised back.

"I think so. Everything's checked out as we expected so far. Kempster has activated every sensor we're carrying, recording it like flek memories are infinite. I expect he'll let us know if he and Renato spot any anomalies."

"Okay. In the meantime I'll plot an initial vector to leave *Lady Mac* with a neutral relative velocity. I can refine it when you've finished working out the coordinate." He suspected *Oenone* could supply him with the appropriate vector within milliseconds. But damn it, he had some pride.

Lady Mac's star trackers locked on to the new constellations they'd mapped. He brought his navigation programs into primary mode and began feeding in the raw data.

Joshua and Syrinx had decided on an interval of several hours before making the final jump to Mastrit-PJ. Partly it was due to their lack of knowledge on its real position and size. Once that was determined, they intended to emerge in the ecliptic plane, a safe distance above the top of the photosphere, with their velocity matched perfectly to the star's. It meant the only force acting on them would be the star's gravity, a tiny tide-like pull inwards. From that vantage point they would be able to scan space for a considerable distance. Logically, the remnants of the Tyrathca's redoubt civilization should be orbiting the star's equator. Possibly on a Pluto-type planet that had survived the explosion, or a large Oort-ring asteroid. Although the volume

of space was admittedly huge, by jumping in steady increments round Mastrit-PJ's equator they should eventually be able to find it.

Oenone would also spend the time to completely recharge its energy patterning cells from cosmic radiation, saving its fusion fuel. Not only would that prepare the voidhawk to carry out the search, it would then have the ability to withdraw across a considerable distance, matching *Lady Mac's* sequential jump facility should they unwittingly enter a hostile armed xenoc environment. That was an imaginative worst-case scenario dreamt up by Joshua, Ashly, Monica, Samuel, and (surprisingly) Ruben; which everyone else cheerfully told them verged on outright paranoia. As it turned out, they'd done quite a good job.

A star is a perpetual battleground of primal forces, principally those of heat and gravity which manifest themselves as expansion and contraction. At its core, a main-sequence star is a giant hydrogen fusion reaction, heating the rest of the mass sufficiently to counter gravitational contraction. However, fusion is only as finite as its fuel supply, while gravity is eternal.

After billions of years of steady luminescence, Mastrit-PJ exhausted the hydrogen atoms of its core, burning them into inert helium. Fusion energy production continued within a small shell of hydrogen wrapped around the central region. Temperature, pressure, and density all began to change as the envelope took over from the core as the principal source of heat. As the transformation of its internal structure progressed, so Mastrit-PJ left its original stable luminous sequence behind at an ever increasing rate. Its outer layers began to expand, heated by convection currents surging up from the growing fusion envelope. While on the inside of the envelope, the core continued its gravitational contraction

as a snow of helium atoms drifted downwards adding to its mass.

Masrit-PJ divided into two distinct and very different entities: the centre burning with renewed vigour as it continued its contraction, and the outer layers bloating out and cooling through the spectrum from white through yellow and into red. That was the epoch of stellar evolution from which the Tyrathca had fled. The expanding star inflated out to over four hundred times its original radius, eventually settling down with a diameter of one thousand six hundred and seventy million kilometres. It swept across the three inner planets, including the Tyrathca homeworld, and quickly devoured the two outer gas-giants. There was no exact line to show where the star ended and space began, instead the inflamed hydrogen thinned out into a thick solar wind which blew steadily out into the galaxy. However, for catalogue and navigational purposes, *Oenone* had defined Masrit-PJ's periphery at seven hundred and eighty million kilometres from its invisible core.

Lady Macbeth was the first to emerge, a respectable fifty million kilometres above the wispy radiant sea of dissolving particles. Normal space had ceased to exist, leaving the starship coasting between two parallel universes of light. On one side, the spectral eddies of the nebula jewelled with young stars; on the other, a flat, featureless desert of golden-hot photons.

Oenone emerged twenty kilometres from the dark Adamist ship.

"Contact locked," Joshua datavised in confirmation to Syrinx as their dish acquired *Oenone*'s short-range beacon. *Lady Mac*'s full complement of survey sensors were rising out of their fuselage recesses, along with the new systems which Kempster had requested. He could actually see a similar suite deploying from the pods riding in the voidhawk's lower fuselage cargo cradles.

"I see you," she replied. "Confirming no rocks or dust clouds in our immediate vicinity. We're starting the sensor sweep."

"Us too."

"How's your thermal profile?"

"Holding fine," Sarha replied when he consulted her. "It's hot out there, but not as bad as the approach to the antimatter station. Our dump panels can radiate it away faster than we're absorbing it. Wouldn't want you to fly us too much closer, though. And if you can give us a slow continuing roll manoeuvre, I'd be happy. It'll avoid any hot-spots building on the fuselage."

"Do my best," he told her. "Syrinx, we can cope. How about you?"

"Not a problem at this distance. The foam insulation is intact."

"Okay." He fired the starship's equatorial ion thrusters, initiating the slow barbecue-mode roll Sarha wanted.

The crew were all at their bridge stations, ready to cope with any contingency the red giant threw at them. Samuel and Monica were down in the main lounge in capsule B, sharing it with Alkad, Peter, and Oski, who were accessing the sensor data. *Oenone's* results were being delivered directly to Parker, Kempster, and Renato. Both ships were exchanging their data in real time, allowing the experts to review it simultaneously.

The image of local space built up quickly, charting the strong riot of particles flowing past the hull. Outside didn't quite qualify as a vacuum.

"Calmer than Jupiter's environment," Syrinx commented. "But just as dangerous."

"Not as much hard radiation as we predicted," Alkad said.

"The hydrogen bulk must be absorbing it before it reaches the surface."

Their optical and infrared sensors were performing slow

scans of space away from the red giant's surface. Analysis programs searched for shifting light-points which would indicate asteroids or moonlet-sized bodies, even a planet. *Oenone's* distortion field could find little local mass bending space-time's uniformity. The brawny solar wind seemed to have blown everything away. Of course, they were looking at less than one per cent of the equatorial orbit track.

The first result came from a simple microwave frequency sensor that picked up an unidentified pulse lasting less than a second. It was coming from somewhere closer to the surface.

"Kempster?" Oski datavised. "Is there any way a red giant could emit microwaves?"

"Not with any of our current theories," the surprised astronomer replied.

"Captain, can we take a closer look at the source, please?"

On the bridge, Joshua gave Dahybi a warning look. Intuition fluttered his heart. "Node status?"

"We can jump clear, Captain," Dahybi said quietly.

"Liol, keep monitoring our electronic warfare detectors, please. I want to play this very safe indeed."

The flight computer reported the sensors had picked up another microwave pulse.

"That's very similar to radar," Beaulieu said. "But not a recognizable Confederation signature. It's nothing like the Tyrathca ships used, either."

"Oski, I'm switching our sensor focus area for you now," Joshua said.

Both passive and active sensor clusters rotated on the end of their booms to study the direction from which the pulse had come. The flight computer assembled their results into a generalized neuroiconic image in accordance with its governing graphic-generation programs, approximating the physical structure which the image enhancement subroutine

was delivering and combining it with a thermal and electromagnetic profile.

“Remind me again,” Sarha said in a subdued breath. “In our expert team’s professional opinion, we’re here for an aeons-dead civilization whose relics are going to be extremely difficult to find. That’s what you sold us, wasn’t it?”

The most powerful telescopes *Oenone* and *Lady Mac* carried were quickly aligned on the structure which the sensor clusters had located, amplifying and clarifying the first low-resolution image. Orbiting twenty million kilometres ahead of the starships, a city was flying unperturbably above the slow-churning blooms of the convection currents which contoured the red giant’s surface. Spectrography confirmed the presence of silicates, carbon compounds, light metals, and water. Microwaves buzzed across its turrets. Butterfly wing magnetic fields flapped in a steady heartbeat. A forest of rapier spines rose from its darkside, gleaming at the top of the infrared spectrum as they radiated away its colossal thermal load.

It was five thousand kilometres in diameter.

21

Quinn used simple timing rather than risk sending his orders out through London's communication net. No matter how innocuous the message, there was always a chance the supercops would pick up the chain. Even though they thought they'd eliminated him in the Parsonage Heights strike, they would be watching for signs of other possessed in the arcology. Standard procedure. Quinn would have done the same in their place. However, their paranoia had been quenched amid the flames and death engulfing the tower's penthouse. With that came a slight relaxation of effort, falling back to established routine rather than determined proactive searches. It gave him the interlude he desired.

By necessity, London was now destined to be the capital of His empire on Earth. Such honour would be visited upon the ancient city and its outlying domes only by using possessed as disciples to deliver His doctrine. But there were inherent problems recruiting them. Even they were reluctant to follow the gospel of God's Brother to its exacting, painful letter. As he'd learned on Jesup, violent coercion was often required to obtain the wholehearted cooperation of non-sect members. Even Quinn was limited in the number of people

he could intimidate at once. And without that strict adherence to His cause, the possessed would do what they always did and snatch this world from the universe. Quinn couldn't allow that, so he'd adopted a more tactical strategy, borrowing heavily from Capone's example, exploiting the hostility and avarice most possessed exhibited on their return to the universe.

The possessed from the Lancini had been carefully and stealthily scattered throughout the arcology and provided with very detailed instructions. Speed was the key. Come the appointed hour, each one would enter a preselected building and open the night staff to possession. When the day workers arrived, they would be possessed one by one, jumping the numbers up considerably but stopping short of exponential expansion. Quinn wanted about 15,000 by ten o'clock in the morning.

After that had been achieved, they would surge out of their buildings and physically disperse across the arcology. By then, there would be little the authorities could do. It took an average of five to ten well-armed police officers to eliminate one possessed. Even if they could track them via electronic glitches, they simply didn't have the manpower available to deal with them. Quinn was gambling that Gov-central wouldn't use 15,000 SD strikes against London. The rest of the population would be his hostages.

While that was going on, Quinn himself would be establishing a core of loyalists who would venture forth to exert a little discipline: again, a hierarchy based on the Organization. The newly emerged possessed would be taught that they had to maintain the status quo, and encouraged to target the police and local government personnel—anyone who could organize resistance. A second stage would see them shutting down the transport routes, then going on to seize power, water, and food production centres. A hundred new

fiefdoms would emerge, whose only obligation was obedience and tribute to the new Messiah.

With his empire founded, Quinn intended to put the non-possessed technicians to work on secure methods of transport that would enable him to carry the crusade of God's Brother to fresh arcologies. Eventually, they would gain access to the O'Neill Halo. From there, it was only a matter of time until His Night fell across this whole section of the galaxy.

The night after the Parsonage Heights incident, patrol constables Appleton and Moyles were cruising their usual route in central Westminster. It was quiet at two o'clock in the morning when their car passed the old Houses of Parliament and turned down Victoria Street. There were few pedestrians to be seen walking along outside the blank glass facades of the government agency office buildings which transformed the start of the street into a deep canyon. The constables were used to that; this was a bureaucrat district after all, with few residents or nightlife to attract anyone after the shops and offices closed.

A body fell silently out of the black sky above the lighting arches to smash into the road thirty metres ahead of Appleton and Moyles. The patrol car's controlling processor automatically reversed power to the wheel hub motors, and turned the vehicle sharply to the right. They braked to a halt almost directly beside the battered body. Blood was flowing out of the jump-suit's sleeves and trouser legs to spread in big puddles across the carbon-concrete surface.

Appleton datavised a priority alert to his precinct station, requesting back-up; while Moyles ordered Victoria Street's route and flow processors to divert all traffic away from them. They emerged from the patrol car with their static-bullet carbines held ready, holding position behind the armoured doors. Retinal implants scanned round in all spec-

trums, motion detector programs in primary mode. There was nobody on the pavements within a hundred metres. No immediate ambush potential.

Cautiously, they started scanning the sheer cliffs of glass and concrete on either side, hunting for the open window from which the body had come. There wasn't one.

"The roof?" Appleton asked nervously. His carbine was swinging about in a wide arc as he tried to cover half the arcology.

The precinct station duty officers were already accessing the Westminster Dome's sensor grid, looking down from the geodesic structure to see the two officers crouched down beside their car. Nobody was on the roofs of the buildings flanking the road.

"Is he dead?" Moyles yelled.

Appleton licked his lips as he weighed up the risks of leaving the cover of the door to dash over to the body. "I think so." Assessing severely battered and bloody flesh it was an old bloke, really old. There was no movement, no breathing. His enhanced senses couldn't detect a heartbeat, either. Then he saw the deep scorch marks branding the corpse's chest. "Oh bloody hell!"

The civil engineering crew had repaired the hole in the Westminster Dome with commendable speed. A small fleet of crawler pods had traversed the vast crystal edifice, winching a replacement segment along with them. Removing the old hexagon and sealing the new segment into place had taken twelve hours. Molecular bonding generator tests were initiated, making sure it was now firmly integrated with the rest of the dome's powered weather defences.

Checking the superstrength carbon lattice girders and beefing up suspect strands of the geodesic structure was still going on as darkness fell; work continued under the pods' floodlights.

Far below them, the clearing up of Parsonage Heights tower was an altogether messier affair. Fire service mechanoids had extinguished the flames in the shattered stub of the octagonal tower. Paramedic crews hauled the injured out of the remaining seven towers of the development project that had been bombarded with a blizzard of shattered glass and lethal debris. Smaller fires had broken out on the two skyscrapers next to the one hit by the SD strike. Council surveyors had spent most of the day examining the damaged buildings to see if they could be salvaged.

There was no doubt that the remnants of the tower struck by the X-ray laser would have to be demolished. The remaining eight floors were dangerously weak; metal reinforcement rods had melted to run out of the carbon-concrete slabs like jam from a doughnut. It was the local coroner's staff who went in there after the fire mechanoids were pulled back and the walls had cooled down. The bodies they recovered were completely baked by the X-ray blast.

It was London's biggest spectator event, drawing huge crowds which spilled over into the open market and surrounding streets. Civilians mingled with rover reporters, gawping at the destruction and the knot of activity on the dome high above. It was the crawler pods which proved that some kind of SD weapon had been used, despite the original denials of the local police chief. By early morning a grudging admission had come from the mayor's office that the police had suspected a possessed to be holed up in the Parsonage Heights tower. When pressed how a possessed had infiltrated London, the aide pointed out that a sect chapel was established in the warehouse below the tower. The acolytes, she assured reporters, were now all under arrest. Those that had survived.

Londoners grew jittery as more facts were prised out of various Govcentral offices over the long morning and afternoon, a lot of the information contradictory. Several lawyers

acting for relatives of the tower's vaporized residents lodged writs against the police for the use of extremely excessive force and accused the Police Commissioner of negligence in not attempting an evacuation first. Absenteeism all over the arcology grew steadily worse during the day. Productivity and retail sales hit an all-time low, with the exception of food stores. Managers reported people were stocking up on sachets and frozen meat bricks.

All the while, images of the broken tower with its blackened, distended, mildly radioactive fangs of carbon-concrete were pushed out by the news companies. Bodybags being carried over the rubble remained the grim background for everybody's day, talked over by new anchors and their specialist comment guests.

A police forensic team was sent in with the coroner's staff. Their orders weren't terribly precise, just to search for anomalies. They were backed up by three experts from the local GISD office, who managed to remain anonymous amid everyone else poking round the restricted area.

The crowd went home before nightfall, leaving just a simple police cordon, patrolled by officers who fervently wished they'd drawn a different duty that evening.

A preliminary forensic report was compiled before midnight by the GISD experts, who had been following their police colleagues' tests and analyses. It contained nothing of the remotest relevance to Banneth or Quinn Dexter.

"One was just going through the motions anyway," Western Europe told Halo and North America after he'd accessed the report. "Although I'd dearly like to know how Dexter pulled that invisibility stunt."

"I think we should just count ourselves fortunate that none of the other possessed seem capable of it," Halo said.

"That SD strike has caused quite a stir," North America said. "The honourable senators are demanding to know who gave SD command the authority to fire on Earth. Trouble is,

this time the President's office is screaming for the same answer. They may try to launch a commission of inquiry. If the executive and the representatives both want it, we might have trouble blocking them."

"Then don't," Western Europe said. "I'm sure we can appoint someone appropriate to chair it. Come on, I shouldn't have to explain basic cover-your-arses procedure. That strike request is logged from the Mayor's civil defence bureau to SD command. It was a legitimate request. Senior Govcentral officers have the right to call for back up from Earth's military forces in emergency. It's in the constitution."

"SD Command should have requested fire authority from the President," Halo said bluntly. "The fact they can actually fire on Earth without the appropriate political authorization has raised a few eyebrows."

"South Pacific isn't stirring this, is she?" Western Europe asked sharply.

"No. Frankly, she has as much to lose as the rest of us. The current Presidential defence advisor is hers; he's doing a good job in damage limitation."

"Let's hope it's sufficient. I'd hate to pull the plug on the President right now. People are looking for leadership stability to get them through this."

"We'll ensure the news agencies will mute the story however loud the senators shout," Halo said. "Shouldn't be a problem."

"Jolly good," Western Europe said. "That just leaves us with the problem of the ordinary possessed."

"New York's a mess," North America admitted glumly. "The remaining non-possessed citizens are defending themselves, but I expect they'll lose eventually."

"We'll have to call another full B7 meeting," Western Europe concluded without enthusiasm. "Decide what we're going to do in that eventuality. I for one have no intention of

being carried off to this realm where the other planets have vanished to.”

“I’m not sure we’ll get a full turnout,” Halo said. “South Pacific and her allies are pretty pissed with you.”

“They’ll come round,” Western Europe said confidently.

He never did get a chance to find out if he was right. London’s deputy Police Commissioner datavised him at quarter past two with the news of the body in Victoria Street.

“There’s was no identification on the old boy,” the deputy commissioner reported. “So the constables took a DNA sample. According to our files, it’s Paul Jerrold.”

“I know the name,” Western Europe said. “He was quite wealthy. You’re sure the burn marks were caused by white fire?”

“They match the configuration. We’ll know for sure when the forensic team gets there.”

“Okay, thank you for informing me.”

“There’s something else. Paul Jerrold was a zero-tau refugee. He transferred his holdings to a long-term trust and went into stasis last week.”

“Shit.” Western Europe sent a fast inquiry into his AI, which ran an immediate search. Paul Jerrold had entrusted himself to Perpetuity Inc., one of many recently formed companies specialising in providing zero-tau for the elderly wealthy. The AI’s review of the company’s memory core established Jerrold had been sent to an old department store called Lancini which Perpetuity Inc. was renting until more suitable premises could be built.

Under Western Europe’s direction, the AI shifted its attention to the department store, reactivating ancient security sensors on every floor. Hall after hall filled with bulky zero-tau pods jumped into blue-haze focus. The AI switched to the only scene of activity. Perpetuity Inc. had set up a monitor centre in the manager’s old office; a couple of night-shift technicians were sitting by their desks, drinking tea and

keeping an eye on an AV projector squirting out a news show.

“Datavise them,” Western Europe ordered the deputy commissioner. “Tell them to switch off Paul Jerrold’s pod and see who’s in there.”

It took a short argument before the technicians agreed to do as they were asked. Western Europe waited impatiently as the ancient cage lift creaked it way up to the fourth floor and they walked over to the Horticulture section. One of them switched the pod off. There was no one inside.

Thoroughly unnerved, they now did exactly as they were told, and went along the row of zero-tau pods switching them off. All of them were empty.

“Clever,” Western Europe acknowledged bitterly. “Who’s going to notice they were missing?”

“What do you want to do?” the deputy commissioner asked.

“We have to assume the zero-tau refugees have been possessed. There are four hundred pods in the Lancini; so get some of your officers in there immediately, find out exactly how many people have been taken. Next, seal off London’s domes and shut down all the internal transport systems. I’ll have the Mayor’s office declare an official civil curfew has been enacted. We might have got lucky; it’s two-thirty, ninety-five per cent of the population will be at home, especially after today’s frights. If we can keep them there, then we can prevent the possessed from spreading.”

“Patrol cars are on their way.”

“I also want every duty forensic team in the arcology shifted over there now. You’ve got thirty minutes to get them inside. Have them examine every room which looks like someone’s been inside recently. Staff rooms, store rooms, the kind of locations where there aren’t any security sensors. They’re to search for human traces. Every piece they find is to be DNA tested.”

There were other orders. Tactical preparation. All police and security personnel were woken and called in, ready to be deployed against the possessed. Hospitals were put on amber status three, preparing for heavy casualties. The arcology's utility stations were put under guard, their technicians billeted in nearby police stations. GISD members were put on standby.

As soon as the administration was underway, orchestrated by the mayor's civil defence bureau but actually run by B7's AI, Western Europe called his colleagues. They appeared slowly and grudgingly in the sensenviron conference room. North and South Pacific were the last to show.

"Trouble," Western Europe told them. "It looks like Dexter managed to take over nearly four hundred people while he was here."

"Without you knowing?" an incredulous Central America asked. "What about the AI search programs?"

"He snatched them from zero-tau pods," Western Europe said. "You should check the companies offering people stasis in your own arcologies. It was a blind spot."

"Obvious with hindsight," North America said.

"Trust Dexter to find it," Asian Pacific said. "He does seem to have an unnervingly direct talent to find our weaknesses."

"Not any more," Halo said.

"I really hope so," Western Europe said. It was the first sign of hesitancy he'd ever shown. The others were actually shocked into silence.

"You hit him with a Strategic Defence X-ray laser!" Eastern Europe said. "He couldn't survive that."

"I'm hoping the forensic tests at the Lancini will confirm that. In the meantime, we've reactivated his psychological profile simulation to determine what he was hoping to achieve with these new possessed. The fact that they've been dispersed, indicates some kind of attempted coup. Let-

ting the possessed run wild doesn't help him. Remember, Dexter wants to conquer humanity on behalf of his Light Bringer. It's likely he wanted control over a functioning arcology, which he could then use as a base to further his ambitions."

"Question," Southern Africa said. "You said Paul Jerrold was a victim of white fire. That indicates he wasn't a possessed."

"This is where it gets interesting," Western Europe said. "Assume Jerrold was possessed, and Dexter sent him out with all the others from the Lancini. They spread out over London, and start possessing new recruits for the cause. One of those new arrivals is our ally from Edmonton, the friend of Carter McBride."

"Shit, you think so?"

"Absolutely. He overpowers Paul Jerrold's possessor, and gives us a warning impossible to ignore. Apparently those two constables nearly had a heart attack when the corpse landed in front of their patrol car. Do you see? He's telling us that the possessed are active, and letting us know where they came from. Dexter's entire operation was exposed by that single act."

"Can you stop them?"

"I think so. We were given enough advance notice. If we can prevent the arcology's population from congregating, then the possessed will have to move themselves. Movement exposes them, makes them vulnerable."

"I don't know," East Asia said. "Put one possessed into a residential block, and they don't have to move about much to possess everybody in there with them."

"We'll see it happening," Western Europe said. "If they bunch together in that kind of density they won't be able to disguise their glitch-effect from the AI."

"So you see it happening," South Pacific said. "So what? No police team will be able to pacify a block filled with two

or three thousand possessed. And it won't be just one block, you said there were hundreds of people missing from the Lancini. If you have a hundred residential blocks taken over, you will not be able to contain them. B7 certainly cannot independently order a hundred SD strikes, not after Parsonage Heights."

"We're right back to our original problem," Southern America said. "Do we exterminate an entire arcology to prevent the Earth being stolen from us?"

"No," Western Europe said. "We do not. That's not what we exist for. We are a police and security force, not megalomaniacs. If it looks like there is a runaway possession effect in one of the arcologies, then we have lost. We accept that loss with as much grace as we can muster and retreat from this world. I will not be a party to genocidal slaughter. I thought you all realized that by now."

"Dexter beat you," Southern Pacific said. "And the prize was our planet."

"I can contain four hundred possessed in London," Western Europe said. "I can contain four thousand. I might even manage fifteen thousand, though it will be bloody. Without Dexter they are just a rabble. If he's still alive, he will assume control, and Earth will not be lost. He will not permit that to happen. It's not London we have to worry about."

"You don't know anything," South Pacific said. "You can't do anything. All any of us can do now is watch. And pray that the Confederation Navy anti-memory can be made to work. That's what you've reduced us to. You think I'm stubborn and cold blooded. Well, I choose that over your monstrous arrogance every time." Her image vanished.

The other supervisors followed her until only North America and Halo were left.

"The bitch has a point," North America said. "There's not an awful lot left for us to do here. Even if you're successful with London, it'll be Paris, New York, and the others which

drag us down. They're a lot further along the road to total possession. God damn, I'm going to hate leaving."

"I didn't tell our fraternal colleagues everything," Western Europe said calmly. "Thirty-eight of the people missing from the Lancini only arrived there yesterday, after the Parsonage Heights strike. In other words, the plot to snatch and possess them was still operating up until about nine hours ago. And we know it's Dexter's operation; the friend of Carter McBride made that quite clear when he delivered Jarrold."

"Holy shit; he's still alive," Halo exclaimed. "Good God, you hit him with an SD weapon, absolute ground zero. And he survived. What the hell is he?"

"Smart and tough."

"Now what do we do?" Northern America asked.

"I play my ace," Western Europe said.

"You have one?"

"I always have one."

The terrible, tragic cries were still faint. Quinn pushed himself deeper into the ghost realm than he had ever done before, so much so he had reduced himself to little more than the existence-impooverished ghosts themselves. He flung his mind open, listening to the ephemeral wailing that came from somewhere still further away from the real universe. The first ones he'd sensed were human, but now he was closer he thought there were others. A kind he didn't recognize.

These were nothing like the woeful pleas that issued forth from the beyond. These were different. A torment more refined, so much graver.

Strange to think that somewhere could be worse than the beyond. But then the beyond was only purgatory. God's Brother lived in an altogether darker place. Quinn's heart lifted to think he might be hearing the first stirrings of the

true Lord as He rose to lead His army of the damned against the bright angels. A thousand times that long night, Quinn called out in welcome to the entities whose cries he experienced, flinging all his power behind the silent voice. Yearning for an answer.

None was granted.

It didn't matter. He had been shown what was. Dreams laid siege to the furthest limits of his mind while he floated within the ghost realm. Darkling shapes locked together in anguish, a war which had lasted since the time of creation. He couldn't see what they were, like all dreams they danced away from memory's focus. Not human. He was sure of that now.

Warriors of the Night. Demons.

Elusive. For this moment.

Quinn gathered his thoughts and returned to the real world. Courtney yawned and blinked rapidly as Quinn's toe nudged her awake. She smiled up at her dark master, uncurling off the cold flagstones.

"It's time," he said.

The possessed disciples he had chosen stood in a silent rank, waiting obediently for their instructions. All around them, the ghosts of this place howled their anger at Quinn's desecration, bolder than any he had encountered before, but still helpless before his might.

Billy-Joe came ambling along the aisle, scratching himself with primate proficiency. "It's fucking quiet outside, Quinn. Some kind of weird shit going down."

"Let's go and see, shall we?" Quinn went out into the hated dawn.

The curfew announcement was glowing on the desktop block's screen when Louise and Genevieve woke. Louise read it twice, then datavised the room's net processor for confirmation. A long file of restrictions was waiting for her,

officially informing her that the mayor had temporarily suspended her rights of travel and free association.

Gen pressed into her side. "Are they here, Louise?" she asked mournfully.

"I don't know." She cuddled her little sister. "That Parsonage Heights explosion was very suspicious. I suppose the authorities are worried some of them escaped."

"It's not Dexter, is it?"

"No, of course not. The police got him in Edmonton."

"You don't know that!"

"No, not for certain. But I do think it's very unlikely he's here."

Breakfast was one of the few things which the curfew didn't prohibit. When they arrived at the restaurant, the hotel's assistant manager greeted them in person at the door and apologised profusely for the reduction in service, but assured them that the remaining staff would do their utmost to carry on as normal. He also said that regretfully, the doors onto the street had been locked to comply with the curfew edict, and told them the police were being very strict with anyone they found outside.

Only a dozen tables were occupied. In fearful exaggeration of the curfew order, none of the residents were talking to each other. Louise and Genevieve ate their corn chips and scrambled eggs in a subdued silence, then went back upstairs. They put a news show on the holographic screen, listening to the anchor woman's sombre comments as they looked out over Green Park. Flocks of brightly coloured birds were walking along the paths, pecking at the stone slabs as if in puzzlement as to where all the humans had gone. Every now and then, the girls saw a police car flash silently along Piccadilly and travel up the ramp onto the raised expressway circling the heart of the old city.

Genevieve got bored very quickly. Louise sat on the bed watching the news show. Rover reporters were stationed at

various vantage-point windows across the arcology, relaying similar views of the deserted streets and squares. The Mayor's office, ever mindful of its public relations dependency, had granted some reporters a licence to accompany constables in patrol cars. They faithfully delivered scenes of constables chasing groups of shifty youths off the streets where they were hanging in spirited defiance of authority. An unending number of senior Govcentral spokespersons offered themselves up for interview, reassuring the audience that the curfew was a precaution indicative of the mayor's strong leadership and his determination London should not become another New York. So please, just cooperate and we'll have this all sorted out by the end of the week.

Louise turned it off in disgust. There was still no message from Joshua.

Genevieve laced on her slipstream boots and went down to the lobby to practice her slalom techniques. Louise went with her, helping to set up a line of Coke cartons along the polished marble.

The little girl was half way down her run, and pumping her legs hard, when the main revolving door started moving, allowing Ivanov Robson into the lobby. She squeaked in surprise, losing all concentration. Her legs shot from under her, sending her on another painful tumble against the marble. Momentum kept skidding her right up to Robson's shoes. She bumped up against him.

"Ouch." She rubbed her knee and her shoulder.

"If you're going to do that, you should at least wear the right protective sports kit," Robson said. He put a big hand down and pulled her upright.

Genevieve's feet began to slide apart; she hurriedly double clicked her right heel before she made another undignified tumble.

"What are you doing here?" she gasped.

He glanced at the receptionist. "I've been asked to collect the pair of you."

Louise glanced through the glass panes of the revolving door. There was a police car parked outside, its windows opaqued. Private detectives couldn't acquire official transport during a curfew, no matter how well placed the contacts they claimed to have. "By whom?" she enquired lightly.

"Someone in authority."

She didn't feel in the least bit perturbed by this development. Quite the contrary, this was probably the first time he was being completely honest with them. "Are we under arrest?"

"Absolutely not."

"And if we refuse?"

"Please don't."

Louise put an arm round Gen. "All right. Where are we going exactly?"

Ivanov Robson grinned spryly. "I have absolutely no idea. I'm rather looking forward to finding out myself." He accompanied them back up to their room, urging them to pack everything as quickly as possible. The doorman and a couple of night porters picked up all their bags and struggled downstairs with them.

Robson settled their account with the receptionist, brushing aside Louise's half-hearted protests. Then they were out through the revolving door and into the back of the police car, their bags being placed in the boot.

"This is very comfy," Louise said as Robson climbed in and took a seat opposite them. The interior was more like a luxury limousine, with thick leather seats, air conditioning, and one-way glass. She half-expected a cocktail bar.

"Not quite your standard arrest wagon, no," he agreed.

They accelerated along Piccadilly and curved smoothly up onto the circular express route. Louise could see all the

hologram adverts glimmering over the empty streets below, the only visible movement in the arcology.

The car shot along the web of elevated roads threaded round the skyscrapers, and she imagined millions of pairs of eyes behind the blank glass facades looking out to see them flash past. People would wonder what they were doing, if they were rushing to contain an outbreak of possession. There was no other reason for the police to be active. Not even the mayor himself was allowed out of 10 Downing Street, as his press office had been keen to point out a hundred times that morning.

Curiosity was becoming a very strong force in Louise's head. She was keen to meet the person who had summoned them. There had obviously been so much going on around her of which she was totally ignorant. It would be nice to have an explanation. Even so, she couldn't for the life of her work out why anyone so powerful would want to see her and Gen.

Her hope that all would be quickly revealed was doused as the police car took a ramp down to the base of the rim and drove straight into an eight-lane motorway tunnel. A huge set of doors rumbled shut behind the car, sealing them in. Then there was nothing but the carbon-concrete walls lit by glareless blue-white lights. More than the arcology, the broad deserted motorway gave her the greatest impression of the curfew and the sense of fear powering London's residents into obedience.

Some unknown distance later, they turned off the motorway into a smaller tunnel road, leading down to the subterranean industrial precincts. The car delivered them to a huge underground garage with the style of arching roof more suited to a train station in the age of steam. Long rows of grubby heavy-duty surface vehicles stood unattended in their parking bays. The police car drove along until they came to the end bay, containing a Volkswagen Trooperbus.

Two technicians and three mechanoids were fussing round the big vehicle, getting it ready for its trip.

The car door slid open, sending in a wave of hot humid air that reeked of fungal growth. Holding her nose in exaggerated disdain, Genevieve followed Robson and her sister out to look at the vehicle. The Trooperbus had six double wheels along each side, one and a half metres in diameter with tread cracks deep enough to hold Genevieve's hand. A heavy retractable track bogie was folded up against its rear, capable of pushing it out of quagmires which came up over the wheel axles. Its dirty olive-green body resembled a flat-bottomed boat hull, with small oblong windows set along the side, and two large angled windscreens at the front. All the thick glass was tinted a deep purple. With its steel and titanium armour bodywork it weighed thirty-six tonnes, making it virtually impossible for an Armada Storm to flip it over. Just to make sure, there were six ground securement cannons, which could fire long tethered harpoons into the earth for added stability in case it was ever caught outside in rough weather.

Genevieve slowly looked along the length of the brutish mud-splattered machine. "We're going outside?" she asked in surprise.

"Looks that way," Robson replied cheerfully.

One of the mechanoids was directed to unload the sisters' department-store bags, transferring them to a locker on the side of the Trooperbus. A technicians showed them the hatchway.

The main cabin of the Trooperbus was designed to hold forty passengers; this one was fitted with ten very comfortable leather upholstered swivel chairs. There was a toilet and small galley at the back, and a three-seat cab at the front. Their driver introduced himself as Yves Gaynes.

"No stewardess on this trip," he said, "So just have a rum-

mage round in the lockers if you need anything to eat or drink. We're well stocked."

"How long is this going to take?" Louise asked.

"Should be there for afternoon tea."

"Where exactly?"

He winked. "Classified."

"Can we watch out of the front?" Genevive asked. "I'd love to see what Earth's really like."

"Sure you can." He gestured her forward, and she scrambled up into the cab.

Louise glanced at Robson. "Go ahead," he told her. "I've been outside before." She joined Gen in the spare seat.

Yves Gaynes sat in front of his own console and initiated the startup routine. The hatch closed, and the air filters cycled up. Louise let out a sigh as the air cooled, draining out the moisture and smell. The Trooperbus rolled forwards. At the far end of the garage, a slab of wall began to slide upwards, revealing a long carbon-concrete ramp saturated in sunlight bright enough to make Louise squint despite the heavily shielded glass.

London didn't end along the perimeter of its nine outer domes. The arcology itself was principally devoted to residential and commercial zones; while the industries sited inside were focused chiefly towards software, design, and light manufacturing. Heavy industry was spread around outside the domes in underground shelters ten kilometres long, with their own foundries, chemical refineries, and recycling plants. Also infesting the dome walls like concrete molluscs were environmental stations, providing power, water, and cool filtered air to the inhabitants. But dominating the area directly outside were the food factories. Hundreds of square kilometres were given over to the synthesis machinery capable of producing proteins and carbohydrates and vitamins, blending them together in a million different textural combi-

nations that somehow never quite managed to taste the same as natural crops. They supplied the food for the entire arcolony, siphoning in the raw chemicals from the sea, and the sewage, and the air to manipulate and process into neat sachets and cartons. Rich people could afford imported delicacies, but even their staple diet was produced right alongside the burger paste and potato granules of the hoi polloi.

It took the Trooperbus forty minutes to clear the last of the vast, half-buried carbon-concrete buildings full of organic synthesisers and meat clone vats. Strictly rectangular mounds, sprouting fat heat exchange towers, gave way to the natural rolling topology of the land. The sisters stared out eagerly at the emerald expanse unfurling around them. Louise was struck by growing disappointment, she'd expected something more dynamic. Even Norfolk had more impressive scenery. The only activity here came from the long streaks of bruised cloud fleeing across the brilliant cobalt sky. Occasional large raindrops detonated across the windscreen with a dull *pap*.

They drove along a road made from some kind of dark mesh which blades of grass had risen through to weave together. The same vivid-green plant covered every square inch of land.

"Aren't there any trees?" Louise asked. It looked as though they were driving through a bright verdant desert. Even small irregular lumps she took to be boulders were covered by the plant.

"No, not any more," Yves Gaynes said. "This is just about the only vegetation left on the planet, the old green grass of home. It's tapegrass, kind of a cross between grass and moss, geneered with a root network that's the toughest, thickest tangle of fronds you'll ever see. I've broken a spade before now, trying to dig through the stuff. It goes down over sixty centimetres. But we've got to grow it. Nothing else can stop soil erosion on the same scale. You should see

the floods we get after a storm, every crease in the ground turns into a stream. If they'd had this on Mortonridge it would have been a different story, I'll tell you."

"Can you eat it?" Genevieve asked.

"No. The people who sequenced it were in too big a rush to produce something that would just do the job to build in refinements like that. They just concentrated on making it incredibly tough, biologically speaking. It can withstand as much ultraviolet as the sun can throw at it, and there's not a disease which can touch it. So now it's too late to change. You can't replace it with a new variety, because it's everywhere. Half a centimetre of soil is enough to support it. Only rock cliffs defeat it, and we've got limpet fungi for them."

Genevieve puckered her lips up and pressed herself up against the windscreen. "What about animals? Are there any left?"

"Nobody's really sure. I've seen things moving round out there, but not close, so it could just be knots of dead tapegrass blowing about. There's supposed to be families of rabbits living in big warrens along some of the flood-free valleys. Friends of mine say they've seen them, other drivers. I don't know how, the ultraviolet ought to burn out their eyes out and give them cancer. Maybe there's some species that developed resistance; they certainly breed fast enough for it to evolve, and they always were tough buggers. Then there's people say pumas and foxes are still about, feeding on the rabbits. And I'll bet rats survived outside the domes if anything has."

"Why do you come out here at all?" Louise asked.

"Maintenance crews do plenty of work on the vac-train tubes. Then there's the ecology teams, they come out to repair the worst aspects of erosion: replant tapegrass and restore river banks that get washed away, that kind of thing."

"Why bother?"

"The arcologies are still expanding, even with all the em-

igration. There's talk of building two more domes for London this century. And Birmingham and Glasgow are getting crowded again. We've got to look after our land, especially the soil; if we didn't, it would just wash away into the sea and we'd be left with continents that were nothing more than plateaus of rock. This world's suffered enough damage already, imagine what the oceans would be like if you allowed all that soil to pollute them. It's only the oceans which keep us alive now. So I suppose it boils down to self-interest, really. At least that means we'll never stop guarding the land. That's got to be a good result."

"You like it out here, don't you?" Louise asked.

Yves Gaynes gave her a happy smile. "I love it."

They drove on through the wrecked land, sealed under its precious, protective living cloak. Louise found it almost depressingly barren. The tapegrass, she imagined, was like a vast sheet of sterile packaging, preserving the pristine fields and spinnies which slept below. She longed for something to break its uniformity, some sign of the old foliage bursting out from hibernation and filling the land with colour and variety once more. What she wouldn't give for the sight of a single cedar standing proud; one sign of resistance offered against this passive surrender to the unnatural elements. Earth with all its miracles and its wealth ought to be able to do better than this.

They drove steadily northwards, rising out of the Thames valley. Yves Gaynes pointed out old towns and villages, the walls of their buildings now nothing more than stiff lumps drowned under tapegrass, names decaying to waypoints loaded into the Trooperbus's guidance block. The Trooperbus had left the simple mesh road behind a long time ago when Louise went back into the main cabin to heat some sachets for lunch. They were driving directly across the tapegrass now, big wheels crushing it to pulp, leaving two dark green tracks behind them. Outside, the land was becoming

progressively more rugged, with deepening valleys, and hills sporting bare rock crowns clawed by talons of grey-green lichen and ochre fungus. Gullies carried silver streams of gently steaming water, while lakes rested in every depression.

"Here we are," Yves Gaynes sang out, four hours after they left London.

Ivanov Robson squeezed his bulk into the cab behind the sisters, staring ahead with an eagerness to match theirs. A plain geodesic crystal dome rose out of the land, about five miles wide, Louise guessed; its rim contoured around the slopes and vales it straddled. The dome itself was grey, as if it was filled with thick fog.

"What's it called?" Genevieve asked.

"Agronomy research facility seven," Yves Gaynes replied, straightfaced.

Genevieve responded with a sharp look, but didn't challenge him.

A door swung open at the base of the dome to admit the Trooperbus. Once the door closed, a red fungicide spray shot out from all sides to wash away mud and possible spores from the vehicle's body and wheels. They rolled forward into a small garage, and the hatch popped open.

"Time to meet the boss," Ivanov Robson said. He led the two girls out into the garage. The air was cooler than inside the Trooperbus and the Westminster Dome, Louise thought. She was wearing only a simple navy-blue dress with short sleeves. Not that it was cold, more like a fresh spring day.

Ivanov beckoned them forwards. Genevieve double clicked her heel, and glided along at his side. There was a small four-seater jeep waiting, with a red and white striped awning and a steering wheel. The first one Louise had seen on this planet. It made her feel more comfortable when Ivanov sat behind it. She and Gen took the rear seats, and they started off.

“I thought you didn’t know this place,” Louise said.

“I don’t. I’m being guided.”

Louise datavisited a net processor access request, but got no response. Ivanov drove them into a curving concrete tunnel a couple of hundred yards long, then they were abruptly out in full sunlight. Gen gasped in delight. The agronomy research dome covered a patch of countryside which was the England they knew from history books: green meadows flecked with buttercups and daisies, rambling hawthorn hedges enclosing shaggy paddocks, small woods of ash, pine, and silver birch lying along gentle valleys, giant horse chestnuts and beeches dotted across acres of parkland. Horses were grazing contentedly in the paddocks, while ducks and pink flamingos amused themselves in a lake with a skirt of mauve and white water lilies. In the centre was a sprawling country house that made Cricklade seem gaudy and pretentious in comparison. Three-storey orange brick walls were held together by thick black oak beams in traditional Tudor diagonals, though they were hard to see under the mass of topaz and scarlet climbing roses. Windows of tiny leaded glass diamonds were thrown wide to let the lazy air circulate through the rooms. Stone paths wound through a trim lawn that was surrounded by borders of neatly pruned shrubs. A line of ancient yews marked the end of the formal garden. There was a tennis court on the other side, with two people swatting a ball between them in an impressively long volley.

The jeep took them along a rough track over the meadows round to the front of the house. They turned in through some wrought iron gates and trundled along a cobbled, mossy drive. Swallows swooped mischievously low over the grass on either side, before arrowing back up to the eaves where their ochre mud nests were hidden. A wooden porch around the front door was completely smothered by honeysuckle;

Louise could just see someone waiting amid the shadows underneath.

“We’ve come home,” Genevieve murmured in delight.

Ivanov stopped the jeep in front of the porch. “You’re on your own now,” he told them.

When Louise shot him a look, he was staring ahead, hands gripped tightly on the steering wheel. She was just about to tap him on the shoulder, when the person waiting in the porch stepped forwards. He was a young man, about the same age as Joshua, she thought. But where Joshua’s face was lean and flat, his was round. Quite handsome though, with chestnut hair and wide green eyes. Lips that were curved somewhere between a smile and a sneer. He was wearing a white cricket jumper and tennis shorts; his bare feet shoved into shabby sneakers with a broken lace.

He put a hand out, smiling warmly. “Louise, Genevieve. We meet at last, to coin a cliché yet again. Welcome to my home.” A black Labrador padded out from the house and snuffled round his feet.

“Who are you?” Louise asked.

“Charles Montgomery David Filton-Asquith at your service. But I’d really prefer you to call me Charlie. Everybody here does. As in right, one expects.”

Louise frowned, still not shaking his hand, though he hardly seemed threatening. Exactly the kind of young landowner she’d grown up with, though with a good deal more panache admittedly. “But, who are you? I don’t understand. Are you the one that summoned us here?”

“’Fraid so. Hope you’ll forgive me, but I thought this would be an improvement on London for you. Not very jolly there right now.”

“But how? How did you get us out through the curfew? Are you a policeman?”

“Not exactly.” He pulled a remorseful face. “Actually, I

suppose you could say I rule the world. Pity I'm not making a better job of it right now. Still, such is life."

There was a swimming pool on the other side of the ancient house, a long teardrop shape with walls of tiny white and green marble tiles. It had a mosaic of the Mona Lisa on the floor of the deep end. Louise recognized that, though she couldn't remember the woman flashing her left breast in the original painting. A group of young people were using the pool, splashing about enthusiastically as they played some private-rules version of water polo with a big pink beach ball.

She sat on the Yorkstone slab patio with Charlie and Gen, relaxing at a long oak table which gave her an excellent view out over the pool and the lawns. A butler in a white coat had brought her a glass of Pimms in a tall tumbler, with plenty of ice and fruit bobbing round. Gen was given an extravagant chocolate milk shake clotted with strawberries and ice cream, while Charlie sipped at a gin and tonic. It was, she had to admit, all beautifully civilized.

"So you're not the President, or anything," she enquired. Charlie had been telling them about the GISD, and its bureau hierarchy.

"Nothing like. I simply supervise serious security matters across Western Europe, and liaise with my colleagues to combat global threats. Nobody elected us; we had the ability to dictate the structure and nature of the GISD back when continental governments and the UN were merging into Govcentral. So we incorporated ourselves into it."

"That was a long time ago," Louise said.

"Start of the Twenty-second Century. Interesting times to live through. We were a lot more active in those days."

"You're not that old, though."

Charlie smiled, and pointed across at the rose garden. A neat, sunken square, divided up into segments, each

one planted with different coloured rose bushes. Several tortoise-like creatures were moving slowly among the tough plants, their long prehensile necks standing proud, allowing them to munch the dead flowers, nibbling the stem right back to the woody branch. "That's a bitek construct. I employ twelve separate species to take care of the estate's horticulture for me. There's a couple of thousand of them here altogether."

"But Adamists have banned bitek from all their worlds," Gen said. "And Earth was the first."

"The public can't use it," Charlie said. "But I can. Bitek and affinity are very powerful technologies; they give B7 quite an advantage over would-be enemies of the republic. It's a combination which also allows me to live for six hundred years in an unbroken lineage." He waved a hand over himself in a proud gesture. "This is the thirty-first body I've lived in. They're all clones, you see; parthenogenetic, so I retain the temperament for the job. I'm affinity capable, I had the ability long before Edenism began. I used neurone symbionts at first, then the affinity sequence was vectored into my DNA. In a way, the immortality method which B7 uses is a variant on Edenism's end-of-life memory transfer. They use it to transfer themselves into their habitat neural strata. I, on the other hand, use it to transfer myself into a new, vigorous young body. The clone is grown in sensory isolation for eighteen years, preventing any thought patterns from developing. In effect, it's an empty brain waiting to be filled. When the time comes, I simply edit the memories I wish to take with me, and move my personality over to the new body. The old one is immediately destroyed, giving the process a direct continuity. I even store the discarded memories in a bitek neural construct, so no aspect of my life is ever truly lost."

"Thirty-one bodies is a lot for only six hundred years," Louise said. "A Saldana lives for nearly two centuries these

days. And even us Kavanaghs will last for about a hundred and twenty.”

“Yes,” Charlie said with an apologetic shrug. “But you spend the last third of that time suffering from the restrictions and indignity of age. An illness which only ever gets worse. Whereas as soon as I reach forty I immediately transfer myself again. Immortality and perpetual youth. Not a bad little arrangement.”

“Until now,” Louise took a drink of Pimms, “those previous bodies all had their own souls. That’s quite different from memories. I saw it on a news show. The Kiint said they’re separate.”

“Quite. Something B7 has collectively ignored. Hardly surprising, given our level of conservatism. I suppose our past bodies will have to be stored in zero-tau from now on; at least until we’ve solved the overall problem of the beyond.”

“So you were really alive in the Twenty-first Century?” Gen asked.

“Yes. That’s what I remember, anyway. As your sister says, the definitions of life have changed a lot recently. But I’ve always considered myself to be the one person for all those centuries. That’s not a conviction you can break in a couple of weeks.”

“How did you get to be so powerful in the first place?” Louise asked.

“The usual reason: wealth. All of us owned or ran vast corporate empires during the Twenty-first Century. We weren’t merely multinationals, we were the first interplanetaries; and we made profits that outgrossed national incomes. It was a time when new frontiers were opening again, which always generates vast new revenues. It was also a time of great civil unrest; what we’d called the Third World was industrialising rapidly thanks to fusion power, and the ecology was destabilising at equal speed. National

and regional governments were committing vast resources into combating the biosphere breakdown. Social welfare, infrastructure administration, health care, and security—the fields government used to devote its efforts to—were all slowly being starved of tax money and sold off to private industry. It wasn't much of a jump for us. Private security forces had guarded company property ever since the Twentieth Century; jails were being built and run by private firms; private police forces patrolled closed housing estates, paid for out of their taxes. In some countries you actually had to take out insurance in order to pay the state police to investigate a crime if you were a victim. So you see, evolving to an all-private police force was an intrinsic progression for an industrialized society. Between the sixteen of us, we controlled ninety per cent of the world's security forces, so naturally we collaborated and cooperated on intelligence matters. We even began to invest in equipment and training at a level that would never bring us a fiscal return. It paid us, though; nobody else was going to protect our factories and institutions from crime lords and regional mafias. The crime rate actually started to fall for the first time in decades.

"After that, we made the decision to bring about Govcentral, along with its centralized tax laws, which were slanted in our favour. Our lawyers were parachuted into senior advisory positions to cabinet ministers and state executives, our lobbyists helped steer parliaments and congresses through controversial legislation. B7 was just the formalization and consolidation of our position."

"That's monstrous," Louise said. "You're dictators."

"As is the landowner class on Norfolk," Charlie replied. "Your family is the same as me, Louise, except you're not quite so honest about it."

"People came to Norfolk after the constitution was written, they didn't have it imposed on them."

"I might argue that with you, but I completely understand

your sense of outrage, probably better than you do yourself. I've encountered it enough times down the centuries. All I can ask is that you judge the means by what it achieved. Earth has a stable, comfortably middle-class population free to live their lives more or less as they want. We survived the climate collapse, and we've spread out to colonize the stars. None of that would have been accomplished without a degree of strong leadership, the lack of which is the curse of modern media-accountable democracy. I'd say that was a pretty impressive achievement."

"The Edenists are democratic, and they've prospered."

"Ah yes, the Edenists. Our greatest accidental triumph."

"What do you mean, accidental?" Louise couldn't help her interest. For the first time she was getting to know the truth about the way the world was structured, and its history. The kind of real history that was never filed and indexed. Everything she was denied at home.

"Because we wanted to keep bitek for ourselves we attempted to have the entire technology prohibited," Charlie said. "We knew we could never do it with a political declaration; our control over the legislative and legal establishment wasn't total at that time. So we went with a religious condemnation, building up to it with a decade of negative publicity. We were almost there. Pope Eleanor was ready to declare affinity an unholy desecration, and the ayatollahs were falling into line. We only needed a few more years of pressure, and the independent companies would be forced to abandon further development. Bitek and affinity would have withered away, another dead-end technology. History is littered with them. Then Wing-Tsit Chong went and transferred his personality into Eden's neural strata. Ironically, we hadn't realized the potential of the habitats, even though we were experimenting along similar lines to achieve our own immortality. It forced the Pope's hand; her declaration came just too early. There was still too much bitek and affin-

ity in general use on Earth for her to be obeyed unquestioningly. Its supporters emigrated to Eden, which by then had seceded from our control. We had absolutely nothing to do with shaping their society; after all, it's not one our operatives could infiltrate."

"But you laid down the law for everyone else."

"Absolutely. We control the principal policy aspects of Govcentral, our companies dominate Earth's industry, and in turn Earth's economic power dominates the Confederation. We're the ones who make the majority investment in every new colony world development company, because we live long enough to reap the rewards which come from share dividends that take two centuries to mature. Between us, our financial institutions own a healthy percentage of the human race."

"What for? Nobody can possibly want that much money."

"You'd be amazed. Proper policing and defence consumes trillions of fuseodollars. The Govcentral navy is like a financial event horizon. We still fund our own security, just as we always have. And in doing so, we safeguard everyone else. I own up to being a dictator, but plead that I am as benign as its possible to be."

Louise shook her head in sorrow. "And for all that power and strength, you still couldn't stop Quinn Dexter."

"No," Charlie admitted. "He is our greatest failure. We may well lose this planet, and all of its forty billion souls with it. All because I wasn't good enough to outsmart him. History will brand us as the ultimate sinners, after all. Rightly so."

"He really has won?" Louise asked in dismay.

"We hit him with an SD weapon at Parsonage Heights. Somehow he eluded that. Now he's free to do whatever he wants."

"So he followed us to London."

"Yes."

“You manipulated me and Gen the whole time, didn’t you? Ivanov Robson is one of your agents.”

“Yes, I manipulated you. And I have no regrets or remorse about that. Given what was at stake, it was wholly justified.”

“I suppose so,” she said meekly. “I quite liked Robson, though he was always a little too good to be true. He never made a mistake. People aren’t like that in real life.”

“Don’t concern yourself about him. He’s not an agent; I’m afraid I commandeered him after his trial. Such people are always useful to me. But dear old Ivanov is not a nice man. Not as unpleasant as Banneth, I admit. She was just a human-sized virus, even managed to spook me with her deranged obsessions, and that’s not easy after all the atrocity I’ve witnessed in my life.”

“And Andy? What about him? Was he one of yours as well?”

Charlie brightened. “Oh yes, the romantic sellrat. No. He’s a real person. I never expected you to go and buy a set of neural nanonics, Louise. You are a constant surprise and delight to me.”

She scowled at him over the Pimms. “What now? Why did you bring us here? I don’t believe it was just so you could explain all this to us first hand. It’s not like you’re going to apologize, is it.”

“You were my last throw of the dice, Louise. I had hoped Dexter might try and follow you here. I have one final weapon available which could work. It’s called anti-memory, and it destroys souls. The Confederation Navy developed it, although it’s only in the prototype stage. Which means it has to be used at very close range. If he’d come with you, we might have had a chance to deploy it against him. It would have been my last noble stand. I was quite prepared to face him.”

Louise looked round quickly, her eyes sweeping the garden for any sign of the devil whose face she could never forget. A foolish reaction. But the prospect of Quinn Dexter

doggedly pursuing her across the desolated countryside was chilling. "But he didn't follow us."

"Not this time, no. So I'll be happy to take the pair of you along with me when I leave. I'll make sure you get a flight to Jupiter now."

"You stopped all my messages to Joshua!"

"Yes."

"I want to talk to him. Now."

"That's another piece of unfortunate news, I'm afraid. He's no longer at Tranquillity. He left with a Confederation Navy squadron on some kind of strike against the possessed; even I wasn't able to discover exactly what their mission was. You're quite free to send a message to the Lord of Ruin for confirmation if you want."

"I will," Louise said crossly. She stood up, and put her hand out to Gen. "I want to go for a walk, unless that's against your rules, too. I need to think about everything you've said."

"Of course. You're my guests. Go wherever you wish, there's nothing that can harm you in the dome—oh, apart from some giant hogweed, there's a clump growing by one of the streams. It stings rather badly."

"Fine. Whatever."

"I hope you'll join me for supper. We normally meet for drinks on the terrace beforehand, around half past seven."

Louise didn't trust herself to say anything. With Gen's hand clasped tightly in her own, she walked off across the lawn, angling away from the swimming pool and its happy crowd.

"That was all ultra stupendously incredible," Gen gushed.

"Yes. Unless, of course, he's the biggest liar in the Confederation. I've been so stupid. I did everything he wanted me to, just like some dumb clockwork doll set in motion. How could I ever have thought you and I would be let off

with a police caution for trying to smuggle a possessed down to Earth? They execute people for less than that.”

Gen’s expression was puppyishly mournful. “You didn’t know, Louise. We’re from Norfolk, we’re never told *anything* about how things are on other worlds. And we escaped from Dexter twice, by ourselves. That’s more than Charlie ever managed to do.”

“Yes.” The trouble with her anger was that all its considerable heat was focused inwards, against herself. The B7 people had done everything they should have to protect Earth. Charlie was right, she was completely expendable. She hadn’t understood how big a danger Dexter was to the universe. Even so, not to have realized anything untoward was happening, other than a vague disquiet about Robson . . . Stupid!

They walked across the lawn and through one of the magnolia hedges, finding themselves in an apple orchard. The short trees were showing their considerable age through twisted trunks and gnarled grey bark. Great clumps of mistletoe hung from their boughs, the parasite’s roots swelling the wood in lopsided bulges. Bitek constructs like miniature sheep with a golden-brown fur were grazing round the trunks, trimming the grass to a neat level.

Gen watched their placid movements for a while, fascinated by how cute they looked. Not exactly the devil’s spawn that Colsterworth’s vicar had condemned every Sunday from his pulpit. “Do you think he will take us to Tranquillity? I’d like to see it. And Joshua,” she added hurriedly.

“I expect so. He’s finished using us now.”

“But how are we going to get up to the Halo? The vac-trains and the towers are shut down, and people aren’t allowed to use spacecraft in Earth’s atmosphere any more.”

“Didn’t you listen to anything? Charlie *is* the government. He can do whatever he wants to.” She grinned and pulled

Gen closer. "Knowing B7, this whole dome can probably blast off into orbit by itself."

"Really?"

"We'll find out soon enough."

They slowly circled the house, comforted by the familiarity of it all. On the other side of the orchard they came across a large dilapidated timber-framed greenhouse, whose shelves were packed with clay pots of cacti and pelargonium cuttings. A servitor chimp shuffled along the aisle, dragging a hose pipe and sprinkling the pots of small green shoots.

"Looks like they have winter in this dome," Louise said to Gen as they peered round the door.

There was an avenue of cherry trees after the greenhouse. A pair of big peacocks strutted around underneath them, their shrill cries ringing through the heavy air. The sisters stood to watch as one of them spread his green and gold tail wide, neck cranked back imperiously. The gaggle of diminutive peahens loose in the avenue continued to peck away at the wiry grass, ignoring the display.

When they crossed the driveway there was no sign of the four-seat jeep, nor Ivanov Robson. They emerged through a gap in a hedge of white fuchsia bushes to find themselves back at the swimming pool. Charlie had vanished from the patio.

One of the girls playing by the pool caught sight of them and waved, shouting as she jogged over. She was a couple of years older than Louise, wearing a purple string bikini.

Louise waited politely, a neutral expression masking a slight sense of discomfort. The bikini was very small. She tried to banish the thought that no Norfolk shop would ever stock it on grounds of decency. Gen seemed perfectly at ease.

"Hi!" the girl said brightly. "I'm Divinia, one of Charlie's friends. He told us you were coming." She pursed her lips at Genevieve. "Fancy a dip? You look hot and bored."

Gen glanced longingly at the group of laughing young

people sporting in the pool, some of them were close to her own age. "Can I?" she asked Louise.

"Well . . . we don't have costumes."

"No probs," Divinia said. "There's plenty spare in the changing room."

"Go on then," Louise smiled. Genevieve flashed a grin and bounded off towards the house.

"I don't want to be rude," Louise said. "But who are you?"

"I told you, darling, Charlie's friend. A very good friend." Divinia followed the line of Louise's gaze, and chortled. She pushed her breasts out further. "When you've got 'em, flaunt 'em, darling. They don't last forever, not even with geneering and cosmetic packages. Gravity always beats us in the end. Honestly, it's worse than taxes."

Louise blushed so hard she had to combat it with a program from her neural nanonics.

"Sorry," Divinia said, smilingly contrite. "Me and my big mouth. I'm not used to people with strong body taboos."

"I don't have taboos. I'm just getting used to things here, that's all."

"Pooie, you poor thing, this world must be dreadfully loud and brash for you. And I don't exactly help make it quiet." She took hold of Louise's fingers, and tugged her towards the pool. "Come on, let's introduce you to the gang. Don't be shy. You'll have fun, promise."

After a second of resistance, Louise allowed herself to be pulled along. You couldn't hold a grudge against someone with such a sunny nature.

"Do you know what Charlie does?" she inquired cautiously.

"Oh God, yes, darling. Lord of all he bloody surveys. That's why I'm with him."

"With . . . ?"

“We shag each other senseless. That kind of with. Mind you, I have to share him with half the girls here.”

“Oh.”

“I’m quite appalling, aren’t I. Dearie me. Not a lady at all.”

“Depends on whose terms,” Louise said pertly.

Divinia’s smile produced huge dimples among her mass of freckles. “Wowie, a genuine Norfolk rebel. Good for you. Give those macho medieval pillocks hell when you get back.”

Louise was introduced to everyone at the pool. There were over twenty of them, six children and the rest in their teens and twenties. Two thirds were girls. All of them quite gorgeous, she couldn’t help noticing. Afterwards, she wound up with her shoes off, sitting on the edge of the pool, dangling her bare feet in the shallow end. Divinia sat down beside her, handing her another glass of Pimms.

“Cheers.”

“Cheers.” Louise took a sip. “How did you meet him?”

“Charlie? Oh, Daddy’s done business with him for simply decades. We’re not as rich as him, of course. Who is? But I’ve got the right pedigree, darling. Not to mention the body.” She swizzled her stick round the glass, her smile taunting. Louise smiled right back.

“It’s a class thing,” Divinia went on. “You don’t qualify for entry in this particular magic circle without a bankload of money, and even that’s not enough by itself. Outlook counts almost as much. You need the arrogance and contempt for the ordinary so that the whole notion of B7 doesn’t shock you. I’ve got that in bucketfuls, too. I was brought up utterly spoiled, tons more money than brains. And I’ve got plenty of brains, too, the best neurones money can sequence. That’s what saved me from the vacuous life of a trust fund babe. I’m too smart for it.”

“So what do you do?”

“At the moment, nothing at all, darling; I’m just here because I’m good company for Charlie. It means I can have fun, and lots of it. Plenty of sex, party with Charlie and Co., have some more sex, access stims, sex again, hit the London clubs, sex, do mountains of gratuitous shopping, sex, see shows and gigs, sex, tour the Halo—freefall sex! That’s where I am in life right now, and I’m doing it to the max. Like I said, everything sags badly and sadly as you get older, so enjoy youth while you’ve got it. That’s the way I turned out, you see, I know myself very well indeed. I know there’s no point living life like this for a hundred years solid. It’s a waste, a total, pitiful waste. I’ve seen the idle rich at sixty, they make me sick. I’ve got money, and I’ve got brains, and I’ve got no scruples; that adds up to a hell of a lot of potential. So when I hit thirty-five or forty, I strike out for myself. I don’t know what I’ll do yet: fly a starship to the core of the galaxy, build a business empire that rivals the Kulu Corporation, start a culture more beautiful than Edenism. Who knows? But I’m going to do it superbly.”

“I always wanted to travel,” Louise said. “Right back as far as I can remember.”

“Excellent.” Divinia knocked her glass to Louise’s with a loud *chink*. “See, you did it. You’ve seen more of the galaxy than I have. Congratulations, you’re one of us.”

“I had to leave home, the possessed were after me.”

“They were after everybody. But you were the one who escaped. That takes balls, especially for someone with your background.”

“Thank you.”

“Don’t worry.” She stroked Louise’s long hair, directing the waving flexitives to slide it back gently over her shoulders. “Somebody will find a solution. We’ll get Norfolk back for you, and blast Dexter’s mind into oblivion along with his soul.”

“Nice,” Louise purred. Sunlight and Pimms were making her deliciously drowsy. She held up her glass for a refill.

Of all the strange days since she'd waved goodbye to her father, this one was undoubtedly the most mentally liberating. Conversing and mixing with Charlie's friends and children left her faintly envious of them. They weren't less moral than her, just different. Fewer cares and hangups for a start. She wondered if true aristocracy meant having the gene for guilt removed. A nice life.

When the appallingly energetic swimmers finally tired, and the sun was edging down the side of the dome, Divinia insisted on taking her for a massage, dismayed by the fact Louise had never had one before. A couple of the other girls joined them in one of the house's original stable blocks which had been converted to a sauna and health spa.

Lying face down on a bench with just a towel over her rump, Louise experienced the painful glory of the masseur's hands pummeling then kneading her muscles. Her shoulders became so loose she thought they'd fall off.

"Who are all the staff here?" she asked at one point. It was hard to believe that everyone in on the secret of B7 could be kept quiet.

"They're sequestered," Divinia said. "Criminals that got caught by GISD."

"Oh." Louise twisted to look at the burly woman who was digging stiff fingers into her calf muscles. She seemed completely unperturbed by having her enslavement discussed openly. The idea bothered Louise, although it wasn't that much different to turning them into Ivets. Either way saw them sentenced to work for others. This method was just more severe. But then she didn't know how bad the original crime had been. Don't think about it. It's not as if I can change anything.

Divinia and the other girls gossiped their way through the massage, twittering and laughing over boys, parties, games. Though it began to take on the tone of a farewell reminis-

cence, places they'd never visit again, friends left out of reach. They talked as though Earth had already been lost.

Louise left the spa tingling everywhere, feeling thoroughly energized. Divinia walked with her back to the house to show her the guest room she'd been given. It was on the first floor, overlooking the orchard. The oak-beamed ceiling was low, barely a foot above Louise's head, giving the room a snug atmosphere. A four-poster bed contributed generously to the theme, as did the rich gold and claret fabrics used for its canopies and the curtains.

All Louise's bags and cases were stacked neatly on the pine blanket box at the foot of the bed. Divinia spied them greedily and started to go through the dresses. The long blue gown was taken out and admired, as were a number of others. None of them were quite right, Divinia declared, but she had something which might just suit the evening.

It turned out to be a quite disgraceful little black cocktail dress that Louise balked at on first sight. Divinia spent a full ten minutes coaxing her into it, outrageously flattering and encouraging. When it was on, Louise suffered a whole new plague of misgivings; you needed supreme confidence to wear anything like this in front of other people.

Genevieve came in just before they were due to go downstairs. "Blimey, Louise," she said, wide-eyed at the dress.

"I'm treating myself," Louise told her. "It's just for tonight."

"That's what you said last time."

The admiration she received from Charlie and his friends when she emerged out onto the terrace was reward enough. Charlie and the men wore dinner jackets, while the girls were all in cocktail dresses, some even more alluring than Louise's borrowed number.

Outside the dome, the sun had finally reached the horizon. Light spilled out symmetrically from the brilliant orange disk to spread in waves along the crest of the verdant

land. Charlie guided Louise over to the end of the terrace so they could watch it. He handed her a slim crystal flute.

“A champagne sunset shared with a beautiful girl. Not a bad last memory of the old planet, if somewhat laboured. How very considerate of the weather to stay clear for us. Its first favour in five centuries.”

Louise sipped her champagne as she admired the clean elegance of the shimmering orange star. She could remember the air as clear as this above Bytham, how it had been infiltrated by insidious wisps of red cloud. Her last memory of home.

“It’s lovely,” she told him.

She sat next to Charlie for dinner. Inevitably, it was a sumptuous affair; the food exquisite, the wine over a century old. She remembered being enthralled by the topics of conversation, and laughing at stories of mistakes and social catastrophes that could only ever happen to an elite such as this. Even though they knew they would have to abandon their world within days, they had an assurance like no other. After an age exposed to depression and anxiety it was a wonderful to experience such unabashed optimism.

Charlie, of course, made her laugh most of the time. She knew why, and no longer cared. Her clever, persistent seduction, and the effort he put into it, gave her a strong sense of belonging. It was classically played, and hauntingly refined. For a planetary oppressor, he was terribly charming.

He even helped Divinia guide her upstairs at the end of the evening. Not that she was drunk and needed help, she just didn’t want to spoil the mood by putting that nasty little detox program into primary mode. Their hands let go of her just outside her door, allowing her to lean against the frame, happy at the support it offered.

“My bedroom is just down there,” Charlie murmured. His lips kissed Louise gently on her brow. “If you want to.” He put his arm round Divinia, and they moved off down the landing.

Louise closed her eyes, pressing her lips together. She rolled against the wall to face her own bedroom door, and stumbled inside.

Her breathing still wasn't under control, and her skin was flushed. She pushed the door shut firmly behind her. A white silk negligee had been laid out on the bed, it made the little black dress demure by comparison.

Oh sweet Jesus, now what the hell do I do?

She picked up the negligee.

It's not as if anybody here will think less of me for having sex with them. The fact that it was even an option actually made her smile in amazement. There was no order in the universe any more, nothing familiar.

So do I, or don't I? The only guilt I'll carry is what I manufacture for myself. And that's the product of heritage. So for all my bravado, just how independent from Norfolk have I become?

She stood in front of the mirror. Her hair was unbound, the flexitives inert, turning it back into a dark unruly cloak. The negligee clung to her body, showing it off provocatively. Just how aroused she'd become was blatantly obvious. A sultry grin was widening on her face as she acknowledged how sexually formidable she looked.

Joshua had always adored her naked body, almost delirious with praise as she gave herself up to him. Which was the answer, really.

Louise was woken by Genevieve bouncing onto her bed, and shaking her enthusiastically. Her head rose up, face curtained by wild hair. She had a headache and a revoltingly dry mouth.

For future reference, put the detox program into primary mode *before* you fall asleep. Please!

"What?" she croaked.

"Oh come on, Louise, I've been up simply hours."

“Oh God.” Sluggish thoughts designated too-bright neuroiconic symbols, and her neural nanonics datavised a string of instructions to her medical package. It began to adjust her blood chemistry, filtering out the residue of toxicants. “I need the loo,” she mumbled.

“When did you get that nightie?” Gen shouted after her as she tottered towards the en suite bathroom. Fortunately there was a big towelling robe hanging up on the inside of the door. She was able to cover up the first-night-of-the-honeymoon garment before she went back to confront Gen. Her head was a lot clearer thanks to the package’s ministrations, though her body hadn’t caught up yet.

“Divinia loaned it to me,” she said quickly, forestalling any more questions.

Gen’s smile was wretchedly smug; she fell back on the bed, hands behind her head. “You’ve got a hangover, haven’t you?”

“Devil child.”

The breakfast room had a long table of big silver warmers containing a considerable variety of food. Louise went along lifting up each lid. She didn’t recognize half of the items. In the end she settled for her usual of corn chips followed by scrambled eggs. One of the maids fetched her a pot of fresh tea.

Divinia and Charlie arrived just after Louise started to eat. He gave Louise a modest little smile, conveying a tinge of regret. That was the only reference ever made to the invitation.

He ruffled Genevieve’s hair as he sat with them, earning himself a disapproving look.

“So when do we leave?” Louise asked.

“I’m not sure,” Charlie said. “I’m keeping an eye on developments. New York and London are the critical places to watch right now. It looks like New York is going to fall

within a week. The inhabitants can only keep resisting the possessed for so long. And they're losing ground."

"What'll happen if the possessed take over?"

"That's when life becomes really unpleasant. I'm afraid our dear president has woken up to what that many possessed are capable of. He's scared they'll try to take the Earth out of this universe. That gives him two options. He can fire the SD electron beams in a circle around the arcology, and hope they'll do a Ketton and just take themselves and a big chunk of landscape out of here. If not, it's a very stark choice; we either go with them, or the SD weapons are focused on the arcology itself."

"Kill them?" Gen asked in fright.

"I'm afraid so."

"Will he really do that? A whole arcology?"

"I doubt he has the courage to make that kind of decision. He'll consult the senate in an attempt to get them to take the blame, but they'll just give him the authority and pass the buck right back at him without committing themselves. If he does give the order to hit the arcology, then obviously B7 will stop the SD network from actually firing. I'm of the opinion we should let the possessed remove Earth. It's a cold equation, but that outcome causes the least harm in the long term. One day we'll learn how to bring it back."

"You really think that's possible?" Louise asked.

"If a planet can be moved out of the universe, it can be returned. Don't ask me for a timetable."

"So what about London?"

"That's more difficult. As I told my colleagues, if Dexter gains control of enough possessed he'll be able to dictate his own agenda to everyone, possessed and non-possessed alike. If that becomes the case, we might have to use the SD weapons to kill the possessed he commands to take that power away from him."

Louise lost all interest in her food. "How many people?"

“SD weapons have a large target footprint. There’s going to be a lot of innocent bystanders caught. An awful lot,” he said significantly. “There are thousands of possessed that have to be targeted.”

“You can’t. Charlie, you can’t.”

“I know. B7 is actually considering if we should actively help the New York possessed to take over that arcology. If they do so before Quinn expands his power base, then Earth will be taken out of this universe before he can menace it.”

“Oh sweet Jesus. That’s just as bad.”

“Yeah,” he said bitterly. “Who wants to rule the world when it means making those kind of choices. And they do have to be made, unfortunately; we can’t jump ship now.”

After the mild euphoria of yesterday, when they’d finally reached a genuine safe haven, however unorthodox, Charlie’s news left the sisters despondent again. They spent the morning in the drawing room, watching a big AV projection pillar to find out what was happening.

At first they switched between London’s news shows, then Louise found the house’s processors allowed her to access the security sensors studding the Westminster Dome’s geodesic framework. She was also able to superimpose the police tactical display grid over their peerless view of the streets and parks. They could follow events in real time, without the intrusive commentary and speculation from reporters. Not that there was much to see. An occasional running figure. Pulses of bright white light flaring behind closed windows. Police cars converging on a building, heavily armed officers moving inside. Sometimes they came out, hauling possessed off to zero-tau pods. Sometimes they didn’t, leaving a circle of empty cars blocking off the surrounding streets, their strobe lights flashing red and blue in futile distress. Local council offices and precinct stations would burst into flames without warning. No fire appliances

came to their rescue. When the government facility concerned had been consumed, the flames mysteriously died away, leaving a blackened husk of crumbling masonry trapped between two unblemished buildings.

Reports from dwindling police patrols and the AI's monitor programs indicated that small bands of the possessed were moving round by using the tube lines and utility service tunnels. As they infiltrated themselves across the arcology, electrical supplies failed in several districts. Then corresponding sections of the communication net went dead. More and more street-level cameras were targeted, showing a snatched glance of impacting white fire before dying. Rover reporters began to go off-air in mid-senseise. Police datavises also fell, faster than possessed assaults against them could statistically account for. GISD estimated the desertion rate to be reaching forty per cent.

There was still a curfew operating across London, but Govcentral was no longer enforcing it.

Servitor chimps ambled into the drawing room around mid-morning and began packing away the ancient silverware and vases. Their preparations emphasised how desperate the situation was becoming, despite the physical distance between the house and London.

Louise caught sight of Charlie through one of the open patio doors; he was taking his two Labradors for a walk across the lawn. She and Gen hurried out after him.

He stopped at a gate in the row of yew trees, waiting for them to catch up. "I just wanted to give the dogs one last walk," he said. "We'll probably leave tomorrow morning. You'll have to start packing again, I'm afraid."

Gen knelt down and stroked the golden Labrador. "You're not leaving them here, are you?"

"No. They'll be put in zero-tau; I'm definitely taking them with me. And a great deal more, of course. I've spent centuries building up my little collection of knickknacks.

One does become dreadfully sentimental about the stupidest things. I own four domes like this in various parts of the world, each with a different climate. There's a lot of occupation invested in them. Still, look on the bright side, I can literally take the memories with me."

"Where are you going to go?" Louise asked.

"I'm not sure, to be honest," Charlie said. "I'll need a developed world as a base if I want to retain control of my industrial assets. Kulu is hardly going to welcome me, the Saldanas are very territorial. New Washington, possibly, I have influence there. Or I might germinate an independent habitat somewhere."

"But it's only going to be temporary, isn't it?" Louise urged. "Just until we find an answer to all this."

"Yes. Assuming Dexter doesn't come gunning for all of us. He's quite a remarkable person in his own repellent way, at least as competent as Capone. I didn't expect him to consolidate his hold over London quite so quickly. One more mistake added to a depressingly long list."

"What will you do? The President isn't going to order the SD strike, is he? The news said the senate has gone into closed session."

"No, he won't fire today. London's safe from him, at least. Unless he sees red clouds hovering over the domes, he doesn't consider the possessed capable of endangering the rest of the world."

"That's it then, we just leave?"

"I am doing my best, Louise. I'm still trying to locate Dexter's actual position. There's still a chance I can use the anti-memory against him. I'm convinced he's somewhere in the centre of the old city, that's where he's concentrated his blackout procedures. If I can just get someone close enough to him, he can be eliminated. We've built a projector that uses bitek processors, it should work long enough even with the possessed ability to glitch electronics."

“The possessed can sense the thoughts of anyone hostile to them. Nobody dangerous would get near to him.”

“Ordinarily, yes. But we do have one ally. Calls himself the friend of Carter McBride. A possessed who hates Dexter, and has the courage to oppose him. And I know he’s in London; he could probably get close enough. The problem is, he’s as elusive as Dexter.”

“Fletcher could have helped,” Gen said. “He really hated Dexter. And he wasn’t afraid of him, either.”

“I know,” Charlie said. “I’m considering if I should ask him.”

Louise gave him a blank look, sure she’d misheard. “You mean Fletcher is still here?”

“Well yes,” Charlie said, as if surprised at her surprise. “He’s been kept in GISD’s secure holding facility up in the Halo, helping our science team research the physics of possession. They haven’t made much progress, I’m afraid.”

“Why didn’t you tell me?” Louise asked weakly. It was the most wonderful news, even though it was accompanied by guilt for the man whose body Fletcher was possessing. There was also the knowledge she’d have to mourn all over again eventually. But . . . he was still with them. That made all the complications bearable.

“I thought it best not to. You’d both managed to put him behind you. I’m sorry.”

“Then why tell us now?” she asked, angry and suspicious.

“Desperate times,” Charlie replied levelly.

“Oh.” Louise slumped as understanding arrived. She began to wonder just how deep his manipulation went. “I’ll ask him for you.”

“Thank you, Louise.”

“On one condition. Genevieve is taken to Tranquillity. Today.”

“Louise!” Gen yelled.

“Not negotiable,” Louise said.

"Of course," Charlie said. "It will be done."

Gen put her hands on her hips. "I won't go."

"You have to, darling. You'll be safe there. Really safe, not like this planet."

"Good. Then you come, too."

"I can't."

"Why not?" The little girl was fighting tears. "Fletcher wants you to be safe. You know he does."

"I know. But I'm the guarantee that he'll do as he's asked."

"*Of course* he'll kill Dexter. He hates him, you know he does. How can you even think anything else. That's awful of you, Louise."

"I don't think badly of Fletcher. But other people do."

"Charlie doesn't. Do you, Charlie?"

"I certainly don't. But the other members of B7 will need assurances."

"I hate you!" Gen screamed. "I hate all of you. And I won't go to Tranquillity." She ran off back over the lawns towards the house.

"Dear me," Charlie said. "I do hope she'll be all right."

"Oh shut up," Louise snapped. "At least have the courage to acknowledge what you are. Or is that something else you've lost along with the rest of your humanity?"

Just for an instant, she caught sight of his true self in a flickering expression of annoyance. A centuries-old consciousness regarding her dispassionately through its youthful doll. His body was an illusion more skilful than any reality dysfunction the possessed had achieved. Everything he did, every emotion shown, was simply a mental state he switched on when it became appropriate. Five hundred years of life had reduced him to a bundle of near-automatic responses to his environment. Very clever responses, but they weren't rooted in anything she could

recognize as human. Wisdom had evolved him far beyond his origin.

She hurried off after Gen.

The link to the Halo was organized to go through a big holoscreen in one of the house's lounges. Louise sat on a sofa opposite, with Gen cuddled up at her side. The younger girl was all cried out, and the battle of wills had been won. After this, she'd be packed off to Tranquillity. That didn't make Louise feel much better.

Blue lines rippled away from the front of the holoscreen, then a picture swivelled into focus. Fletcher was sitting at some metallic desk, dressed in his full English Navy uniform. He blinked, peering forwards, then smiled.

"My dear ladies. I cannot tell you how gladdened I am to see you safe."

"Hello, Fletcher," Louise said. "Are you all right?" Gen was all sunny smiled, waving furiously at his image.

"It would appear so, my Lady Louise. The scholars of this age have kept me busy indeed, testing and prodding my poor bones with their machines. Much good it has done them. They freely admit Our Lord guards the mysteries of his universe jealously."

"I know," Louise said. "Nobody down here has a clue what to do."

"And you, Lady Louise. How are you and the little one faring?"

"I'm okay," Genevieve blurted spryly. "We've met a policeman called Charlie, who's a dictator. I don't like him much, but he did get us out of London before things got too bad."

Louise laid a hand on Gen's arm, silencing her. "Fletcher, Quinn Dexter is down here. He's running loose in London. I'm supposed to ask, will you help track him down?"

"My lady, that fiend has bested me before. We escaped by

God's grace and a fortuitous quantity of luck. I fear I would be of little use against him."

"Charlie has a weapon that might work if we can get it close enough to him. It has to be a possessed carrying it, no one else stands a chance. Fletcher, it's going to get really bad down here if he isn't stopped. The only alternative the authorities have is to kill lots of people. Millions possibly."

"Aye lady, I already hear the souls stirring in anticipation of what is to come. Many many bodies are being made available for their occupation, with promises of more. I fear the time of reckoning draws nigh. All men will soon have to choose where their hearts lie."

"Will you come down, then?"

"Of course, my dear lady. How could I ever refuse your request?"

"I'll meet you in London, then. Charlie has made all the arrangements. Genevieve won't be there, she's going to Tranquillity."

"Ah. I believe I understand. Treachery lurks under every stone along the path we tread."

"He's doing what he thinks he has to."

"The excuse of many a tyrant," he said sadly. "Little one? I want you to promise me you will cause your sister no distress as you leave for this magical flying castle. She loves you dearly and wishes no harm to befall you."

Genevieve clutched at Louise's arm, trying hard not to blub. "I won't. But I don't want to leave either of you. I don't want to be left alone."

"I know, little one, but Our Lord tells us that only the virtuous can be brave. Show courage for me, be safe even if it means forgoing those who love you. We will be reunited after victory."

22

Right from the start, Al knew it was going to be a bad day.

First it was the body. Al was hardly a stranger to blood, he'd seen and been responsible for enough slaughter in his time, but this was turning his stomach. It had been a while before anyone noticed poor old Bernhard Allsop was missing. Who was going to care that the little weasel wasn't getting underfoot like usual? It was only when he skipped a couple of duty details that Leroy finally got round to asking where he was. Even then, it wasn't an urgent request. Bernhard's processor block didn't respond to datavises, so everyone assumed he was goofing off. A couple of guys were asked to keep an eye out. After another day, Leroy was concerned enough to bring it up at a meeting of senior lieutenants. A search was organized.

The security cameras found him eventually. At least, they located the mess. Confirming first what, then who it was had to be done in person.

There was a quite extraordinary amount of blood smearing the floor, walls, and ceiling. So much so, Al figured that more than one person had been whacked. But Emmet Morden said the quantity was about right for a single adult male.

Al lit a cigar, puffing heavily. Not for pleasure; the smoke

covered the smell of decaying flesh. Patricia's face was creased up in dismay as they stood around the corpse. Emmet held a handkerchief over his nose as he examined the remains.

The face was recognisably Bernhard. Though even now Al remained slightly doubtful. It was as though the skin had been roughly rearranged into Bernhard's features. A caricature rather than a natural face. Al had seen doctored photos before, this was the body equivalent.

"You're sure?" Al asked Emmet, who was prodding the blood-drenched clothing with a long stylus.

"Pretty much, Al. These are his clothes. That's his processor block. And you can't expect his face to be a close match, we only see illusions of each other, remember. His body's face was becoming him, but it takes time."

Al grunted, and took another look. The skin had shrunk to wrap tightly round the skull and jaw; a lot of capillaries had ruptured, and the eyeballs had burst. He turned away. "Yeah, okay."

Emmet plucked the processor block from Bernhard's rigid, clawed fingers, and gestured a couple of non-posessed medical orderlies to take over. They manoeuvred the desiccated corpse into a body bag. Both of them were sweating badly, struggling against nausea.

"So what happened?" Al asked.

"He was trapped in here by the pressure doors, then someone opened the airlock."

"I thought that was impossible."

"This airlock's been tricked out," Patricia said. "I checked. The electronic safeties were blown to shit, and someone sliced through the swing rods."

"You mean it was a proper professional hit," Al said.

Emmet was keying commands into Bernhard's block. There were few coherent responses, small blue spirals of light drifted through the holographic screen, fracturing any

icons which did emerge from the management program. "I think somebody datavised a virus into this. I'll have to link it up to a desktop and run a diagnostic to be sure. But he wasn't able to call for help."

"Kiera," Al said. "She did this. Nothing tripped the alarms. They knew he'd be using this corridor, and when. It takes organization to set up a hit this smart. She's the only one up here who could pull it off."

Emmet scraped at the bloody wall with the tip of his stylus. By now, the blood had dried to a fragile black film. Tiny dark flakes snowed away from the composite instrument. "Several days old, even taking vacuum boiling into account," Emmet said. "Bernhard never turned up for his assignment during the victory party, so I guess that's when it was done."

"Gives Kiera an alibi," Patricia said, sullen with resentment.

"Hey!" Al spat. "There ain't no goddamn federal courts up here. She doesn't get no fancy lawyer to smartmouth her out of this by screwing the jury's mind. If I say she did it, then that's it. Period. The bitch is guilty."

"She won't give herself up easily," Patricia said. "The way she's been stirring things over Trafalgar, the fleet is starting to get jittery about the Navy retaliating. She's got a lot of support, Al."

"Shit!" Al glared at the body bag, cursing Bernhard. Why couldn't the little asshole be stronger? Fight back against the bastards who whacked him, at least take a couple of them back to the beyond with him. Save me all this grief.

He relented. Bernhard had been loyal right from the moment he swung by in his make-believe Oldsmobile and picked up Al back in San Angeles. In fact that loyalty was probably what got him whacked. Chew away at the middle ranks, the really valuable ones, and you erode the power base of the guy at the top.

That motherfucking *bitch*.

“This is interesting.” Emmet was bending down to examine part of the corridor floor at one end of the bloodstain. “These marks here. Could be footprints.”

Suddenly interested, Al went over to take a look. The splotches of dried blood were roughly the right shape and size of someone’s boot sole. There were eight of them, becoming progressively smaller as they led towards the airlock.

He laughed abruptly. Goddamn. I’m doing fucking detective work! Me, a cop.

“I get it,” he said. “If they made prints, then the blood was still wet, right? That means it happened around the time Bernhard was killed.”

Emmet grinned. “You don’t need me.”

“Sure I do.” Al clapped him on the shoulder. “Emmet, my boy, you just made chief of police for this whole crummy rock. I want to know who did this, Emmet. I really want to know.”

Emmet scratched the back of his head, looking round the grisly murder scene, thinking out what needed to be done. These days, getting put on the spot by Al hardly affected his bladder at all. “A forensic team would be useful. I’ll check with Avram, see if we’ve got any police lab people that I can use up here.”

“If there ain’t, get them sent up from the planet,” Al said.

“Right.” Emmet was looking at the pressure door. “The guys doing the hit must have been close; that’s the only way to stop him from getting out. Breaking through a door like this would be no problem to a possessed, even Bernhard.” His stylus tapped the glass port in the middle of the door. “See? There’s no blood on this, even though it’s sprayed across the rest of the surface. They probably took a look at him, make sure he was dead.”

“If they stayed on the other side of the door, where did the footprints come from?”

“Dunno.” Emmet shrugged.

“This corridor got any of those police spy cameras fitted?”

“Yeah. I’ll review all their memories, but it’s pretty doubtful, Al. These guys are pros.”

“See what you can find for me, my boy. And in the meantime, pass the word, I want you guys taking a few precautions. Bernhard’s only the start. She’s gunning for all of us. And I can’t afford to lose any more of you. Capeesh?”

“I hear you, Al.”

“That’s good. Patricia, I think maybe we should return the compliment.”

Patricia’s thoughts swelled with dark delight. “Sure thing, boss.”

“Hit the bitch hard, someone she relies on. What’s that rat-face SOB always following her round? Got the psychic shit with the hellhawks?”

“Hudson Proctor.”

“That’s the guy. Bust his ass back to the beyond. But make sure he suffers some first, okay?”

There was a bunch of people waiting for Al when he got back to the Nixon suite. Leroy and Silvano, talking in low tones with Jez; worry hovering round them like a persistent fog. One guy (possessed) that Al didn’t recognize, who was being covered by a couple of his soldiers. The stranger had a head filled with the strongest thoughts Al had ever come across. His mind burned on pure anger alone. It deepened a shade when Al came in.

“Je-zus, what is going down here? Silvano?”

“Don’t you remember me, Al?” the stranger asked. The tone was dangerously mocking. His clothes began to change, flowing into the full dress uniform for a lieutenant

commander in the Confederation Navy. His face changed as well, stirring Al's memory.

Jezzibella gave Al a nervous flicker of a smile. "Kingsley Pryor's back," she said.

"Hey, Kingsley!" Al smiled broadly. "Man, is it good to see you. Shit, you're a fucking hero around these parts. You did it, man, you actually fucking did it. You wiped out the whole Confederation Navy single-handed. Can you believe this shit?"

Kingsley Pryor produced the kind of wide-eyed smile that troubled even Al. He wondered if the two soldiers were enough to keep the Navy man down.

"You just go right ahead believing that shit," Kingsley said. "That's fine by me. In the meantime, I killed fifteen thousand people for you. Now it's time for you to keep your end of the bargain. I want my wife, my child, and I've decided I want a starship, too. That's a little bonus you're going to award me for completing my mission."

Al spread his arms wide, his thoughts the epitome of reasonableness. "Well, hell, Kingsley, the agreement was you blow up Trafalgar from the inside."

"GIVE ME CLARISSA AND WEBSTER."

Al swayed back a pace. Kingsley was actually glowing: a light deep inside his body had flicked on, illuminating his face and uniform. Except for the eyes, they sucked light down. Both soldiers nervously tightened their grip on the Thompson machine guns they were holding.

"All right," Al said, attempting to calm things down. "Jesus, Kingsley, we're all on the same side here." He conjured up a Havana and held it out, smiling.

"Wrong." Kingsley stuck a rigid finger in the air, preacher-style, and slowly levelled it at Al. "Don't talk to me about taking sides, you piece of shit. I have died because of you. I have slaughtered my comrades because of you. So don't you ever *ever* think you can tell me anything about

faith, or trust, or loyalty. Now you either give me my wife and my son, or we settle this right here and now.”

“Hey, I ain’t holding nothing back. What you want, you got. Al Capone don’t break his word. You understand that? We had an agreement. That’s like solid greenback currency around here these days. And I don’t never welsh. Never! You understand? All I got here is my name, that is all I am worth. So you don’t go questioning that. I appreciate how fucked off you are. Okay, you got that right after what’s happened. But you don’t ever say to no one I went back on my promise.”

“Give me my wife and son.”

Al couldn’t understand how Kingsley’s teeth didn’t shatter, the man was crunching his jaw so hard. “No problem. Silvano, take Lieutenant-commander Pryor here to his wife and kid.”

Silvano nodded, and gestured Pryor to the door.

“And nobody laid a finger on them while you were gone,” Al said. “You remember that.”

Pryor turned at the door. “Don’t worry, Mr Capone, I won’t forget anything that’s happened here.”

Al sank down into the nearest chair when he’d gone. His arm curved round Jez for comfort, only to find she was trembling. “Je-zus H Christ fucking wept,” Al wheezed.

“Al,” Jez said firmly. “You have got to get rid of him. He frightened the bejezus out of me. Maybe sending him to Trafalgar wasn’t one of my better ideas.”

“Too fucking true. Leroy, for Christ’s sake tell me you found that kid of his.”

Leroy was running a finger round his collar. He looked scared. “We didn’t, Al. I don’t know where the little brat’s gone. We looked everywhere. He just vanished.”

“Fuck-a-doodle. Kingsley’s going to blow when he finds out. It’ll be a bloodbath. Leroy, you’d better start calling in

some of the guys. And no fucking marshmallows, either. It's going to take a lot of us to pound him."

"And then he can come straight back into another body," Jez said. "It just starts over again."

"I'll start another search for Webster," Leroy said. "The kid's got to be somewhere, for heaven's sake."

"Kiera," Jezzibella said. "If you really did look everywhere for him before, then he's got to be with Kiera."

Al shook his head in amazed admiration. "Goddamn, I can't believe I was dumb enough to let that woman into this rock. She doesn't miss a single trick."

Etchells emerged from his wormhole terminus ten thousand kilometres out from Monterey. The asteroid was a small grey disk traversing one of New California's sunlit turquoise oceans. Drab, but enormously welcoming. He could almost hear his stomach growling from hunger.

New California's defence network locked on to his hull, and he identified himself to the control centre in Monterey. They cleared him for a five-gee approach. His energy patterning cells couldn't quite manage that.

Clear a pedestal for me, he told the hellhawks on the docking ledge. **I need nutrient fluid.**

We all do, Pran Soo replied tartly. **There's a rota, remember?**

Don't fuck with me, bitch. I've been away longer than I expected. I'm exhausted.

And I'm heartbroken.

Pran Soo's attitude surprised him. Sure, the hellhawks grumbled and quarrelled; and none of them liked him. But this casual superior taunting was something new. He'd have to get to the reason eventually. But that would have to wait. He was genuinely concerned for his condition.

Where the hell have you been? Hudson Proctor asked. **Hesper-LN, if you must know.**

Where? There was a good deal of puzzlement in Hudson's mind.

Never mind. Just get a pedestal ready for me. And tell Kiera I'm back. There's a lot she needs to hear.

One of the feeding hellhawks was ordered to disengage from the pedestal it was using, freeing the metal mushroom for Etchells. He swung in over the ledge with little grace as the affinity band filled with gibes and derision about his flight path. Service crews stood well back as the big bitek starship wobbled uncertainly over the docking pedestal. It settled after a laboured descent, and the feed tubules rose up to insert themselves into its reception orifices. He started to gulp down the nutrient fluid as fast as it could be pumped in.

His on-board bitek processors datavised the section of the habitat Kiera had claimed as her own. She was in a lounge overlooking the docking ledge, sitting on one of its long sofas. Her dress was bright scarlet with a tight bodice fastened by cloth buttons. The skirt was loose enough for her to fold her legs up on the sofa, presenting a feline posture to the camera.

Etchells hesitated for a second, enjoying the small sexual thrill that came from so much young, beautifully shaped female skin on show for his benefit. It was a rare thing for him to wish he hadn't possessed a blackhawk. Kiera could do that. Not many others.

"I was worried about you," she said. "You are my principal hellhawk, after all. So what happened at the antimatter station?"

"Something odd. I think we've got real trouble. This goes way beyond everyone's little power plays. We're going to need help."

Rocio accessed Almaden's net to watch the repair operation. Deebank had kept his part of the bargain, co-opting all the non-possessed technicians left in the asteroid to work on the

nutrient fluid refinery. They had replaced the damaged heat exchanger out on the ledge, resealed the chamber Etchells's laser had breached, stripped down the machinery and rebuilt it using new components manufactured in their own industrial stations. That just left the electronics.

As soon as the *Mindori*'s bulk had settled on one of the asteroid's three docking pedestals, a team had unloaded the packages from its cargo bay. Integrating the new processors and circuits into the refurbished refinery had taken over a day. Operating programs had to be modified. Then start-up proved an arduous task. There were synthesis tests, integral analysis calibration runs, mechanical inspections, performance examinations, fluid quality reviews. Eventually, the first batch was pumped along the pipes to *Mindori*'s pedestal. The hellhawk's internal bitek taste filters took a sample, evaluating the protein structures suspended within the fluid.

"Tastes good," Rocio told the asteroid's expectant population. Their cheers at his verdict reverberated out from the synthesis refinery chamber, spreading like a high-frequency quake throughout the lonely rock.

"Do we have a deal?" a smiling Deebank asked.

"Absolutely. My colleagues will start lifting your people off. Possessed to the nearest world which Capone has seeded; non-possessed to the Edenists."

The haggard non-possessed nearest to the AV pillar broadcasting the link up heaved a huge sigh of relief. The news was passed on back to their hostage families.

Deebank and Rocio carried on their negotiations. The evacuation would be staged. First the refinery had to be checked out thoroughly for long-term continuous operation, any modifications to be made before the crews left. Mechanoids had to be adapted for specialised maintenance work. Technicians would stay on to train the disappointingly few hellhawk possessors who laid claim to a scientific back-

ground. The asteroid's fusion generators were to be overhauled for similar long-term duties. Vast quantities of raw hydrocarbon chemicals for the refinery were to be prepared and stored in tanks which had yet to be fabricated. Fuel supply reserves of deuterium and He3 were to be established so they could feed the remaining generators (not a problem now the settlement's biosphere cavern was to be powered down).

We can begin, Rocio told Pran Soo. Get our core sympathisers on high orbit patrol out here. They've just pulled transport duties. We can start ferrying the population to a possessed world.

Do you want a general exodus to Almaden?

Not yet. We'll keep this development to our group alone for now. It would be nice if more of us received a full weapons load before the Organization realizes we're deserting. Kiera is bound to try some kind of attack when she finds out.

There aren't many of us who'll follow her.

I know, but we play it safe. There's no telling what that bitch is capable of.

Jed and Beth stood behind the lounge's curving window, watching the hellhawks arrive. The creatures swooped down out of the stars to land on the two remaining pedestals. Blunt cylindrical crew buses trundled over the ledge, airlock tubes extending eagerly to mate with the life support capsule hatches.

A small square in the corner of the window shimmered with grey light and turned into Rocio's smiling face. "Looks like we've done it," he said. "I want to thank you; especially you, Jed. I know this hasn't been easy."

"Are they coming on board?" Beth asked.

"No. I'm swallowing back to Monterey in a couple of hours. I'll be missed if I don't report back at the end of my patrol orbit."

Jed's arm went round Beth, instinctively protective. "You said you'd take us to one of the Edenist habitats," he said.

"I will. All the non-possessed from Almaden will be handed over to them once our preparations here are finished. You'll go with them."

"Why can't we go first? We're the ones who helped you. You just said."

"Because I haven't even spoken to the Edenists about this, yet. I don't want their voidhawks showing up here and wrecking everything. Just be patient. You have my word I'll get you out of this."

Rocio cancelled his link to the lounge and began to alter the shape of his distortion field. It pushed him up off the docking pedestal, and he slipped away from the ledge. One of the hellhawks that had just swallowed in from New California passed him as it swooped down towards the vacated pedestal. They exchanged excited smile images across the affinity band.

Rocio's mood lifted further as he accelerated away from the asteroid. It was all coming together beautifully. His next priority was gathering as many fully-armed hellhawks as possible and deploying them to guard Almaden. Then in another couple of days he and Pran Soo would inform the remaining hellhawks about Almaden. Everyone would have to make their choice. He didn't expect many to stay with Kiera; Etchells, of course, probably Lopex; others who hadn't come to terms with their new form, or didn't fully understand its potential. Not enough to ruin the plan.

He swallowed back to New California, resuming his high-altitude patrol orbit. The planet turned peacefully two million kilometres below him. His distortion field swept out, carefully propagated ripples testing and probing the fabric of space-time. No voidhawks within a hundred thousand kilometres. Nor was there any sign of stealthed weapons or

sensor globes heading in towards the Organization ships and stations. Nobody asked him where he'd been.

An internal sensor check showed him the young kids playing some kind of tag game along the main corridor. Jed and Beth were in their cabin, screwing again. Rocio sighed fondly. What it was to be a teenager.

Two hours later, Hudson Proctor ordered him to report to the docking ledge.

What for? Rocio asked. **I have enough nutrient fluid for now.** In fact, he had filled every fluid reserve bladder at Almaden. If they were calling him in ahead of schedule for a feed, he'd have to vent it all before he got to Monterey.

We're going to install some auxiliary fusion generators in your cargo bays, Hudson Proctor said. **You've got the connections to receive power directly from them, haven't you?**

Yes. But why?

There's a long-range mission being planned. You fit the parameters.

What mission?

Kiera will tell you when you've been prepped.

Will I be using combat wasps as well?

Yes, we'll give you a full complement. They'll be loaded at the same time as the fusion generators. Your lasers need checking, too.

I'm on my way.

Al stared at Kiera, not quite believing she had the balls to turn up in his suite like this. Jez was at his side, arm tucked through his; Mickey, Silvano, and Patricia were bunched up behind him, along with half a dozen soldiers. Kiera was backed up by Hudson Proctor and eight of her goons on bodyguard duty. Animosity seeped out from both groups, thickening the air.

"You said it was urgent," Al said.

Kiera nodded. "It is. Etchells has just returned."

"That's the hellhawk who ran from the antimatter station when things looked tough?"

"He didn't run. He found out the Navy was up to something strange there. He thinks one of their ships was loaded with antimatter before the station was destroyed. Afterwards, it rendezvoused with a voidhawk, and the two of them flew to Hesper-LN. That's the Tyrathca world."

"I heard of them. They're like Martians, or something."

"Xenocs, yes."

"So what's this got to do with us?"

"The voidhawk and the other ship were very interested in an old Tyrathca spaceship that's orbiting Hesper-LN. Etchells thinks they put a team on board. After that, they took off for the Orion Nebula. That's where the Tyrathca came from originally. And it's a long way away."

"One thousand six hundred light-years," Jezzibella said.

"So?" Al asked. He couldn't work out her angle. "So what's this got to do with us?"

"Think about it," Kiera said. "We're in the middle of the biggest crisis the human race has ever known. And the Confederation Navy breaks the one law it enforces above all others. It actually helps fill a starship up with antimatter. Then that ship and another fly somewhere no other human has ever been before. And they're looking for something. What?"

"Fuck's sake," Al muttered. "How do I know?"

"It has to be something very, very important to them. Something the Tyrathca have got and the Navy wants. Bad enough to risk a war. Etchells said they actually fired on the Tyrathca ships when they were orbiting Hesper-LN. Whatever it is, they are desperate to get their hands on it."

"You trying to jerk me around here?" Al asked Kiera. He was losing his cool about the whole phoney meeting. Then, he always did when the talk turned to that space and ma-

chines stuff he couldn't quite follow. "We've been through all this superweapon shit before. I sent Oscar Kern and some guys after that Mzu broad and an Alchemist bomb. Fuck lot of good that did me."

"This is different," Kiera insisted. "I don't know exactly what the Navy's after, but it has to be something they can use against us. If it is a weapon, then it must be an extremely powerful one. Ordinary weapons are useless against us. If the Navy does put together enough force to harm us, we just leave this universe behind. They know that, especially after Ketton. We automatically protect ourselves; nothing can reach us on the other side. Nothing human, that is."

"Ho boy; lady, have you ever changed your tune. Yesterday you were telling me how nothing the longhairs dream up could ever touch us if we take New California out of here."

"This is xenoc technology. We don't know what it's capable of."

"This is bullshit," Al said in exasperation. "Maybe. If. Perhaps. Might be. You got zip and you know it. Know what? I heard this speech once before. The prosecution lawyer at my last trial used it. Everyone knew it was a bunch of crap then, and there ain't nothing changed since. And let me tell you, dark sister, you ain't even as convincing as he was."

"If the Confederation has something that can reach the planets we've removed, then we've already lost."

"Yeah? What's the matter, Kiera, running scared?"

"I can see I'm wasting my time. I should have known this was going to fly straight over your head." She turned to go.

Al got a hold on his temper. "Okay. Hit me."

"We send some ships after them," Kiera said. "I'm already preparing three hellhawks for pursuit duty. Just forget about our beef for one hour, and assign some of your frigates to go with them."

“You mean frigates armed with antimatter,” Al said.

“Of course. We have to have superior firepower. If possible, we capture the Tyrathca weapon. If not, we destroy it along with the Navy ships.”

Al chewed the idea over for a minute, enjoying the way Kiera got all antsy at the delay. “You want to cut a deal?” he asked. “Okay, I’ll tell you what I’ll do for you, and this is only because you’ve come over all noble about our future. I’ll let you have a couple of frigates; I’ll even arm them with half a dozen antimatter combat wasps each for you. How’s that?”

Kiera gave a relieved smile. “That’s good for me.”

“Glad to hear it.” Al’s grin shrank to nothing. “In return, all you gotta do is give me Webster.”

“*What?*”

“Webster fucking Pryor. That’s what.”

Kiera gave Hudson Proctor a confused look. The general shrugged with equal bewilderment. “Never heard of him,” he said.

“Then until you remember, it’s no deal,” Al said.

Kiera glared at him. For a moment, Al thought she was going to go for it.

“Fuckhead!” Kiera yelled. She spun round and stormed out.

“She’s sure got a way with words,” Al chuckled. “Real lady.”

Jezibella couldn’t share his humour. She had a troubled expression on her face as she regarded the big doors that had closed behind Kiera. “Maybe we should have a talk with Etchells ourselves,” she said. “Find out what the hell is going on.”

Everyone around Kiera kept very quiet as they took the lift up to the Hilton’s lobby. Her fury at Capone’s stupidity gradually cooled to an iron-hard determination. Capone

would have to be disposed of, and quickly. No question about it.

After that, there were new questions.

Etchells's story bothered her badly. She simply couldn't believe the Navy would send ships to the Orion Nebula without a very good reason. It had to be connected to possession somehow. With a weapon as the obvious choice. Infuriatingly, if that was the case, then Capone had been right all along about staying here and making a stand.

If she stuck with the original plan, to transfer the Organization down to New California and leave the universe, then there'd be no way to counter any future developments which the Confederation might make. Always a factor, but now requiring more urgent consideration.

And of course, once she gained control of the Organization fleet, she could dispatch a whole squadron of antimatter-armed frigates to the Orion Nebula. But then, she'd have to go with them. A quick glance at Hudson Proctor confirmed that. He was loyal, but only because she was the ride he'd chosen to get him to the top. Give him the chance to intercept a Tyrathca superweapon by himself, and he'd do to her what she was about to do to Capone. It was a bad corner to be backed into.

The lift door opened and she strode out into the lobby. This section of the Hilton was actually embedded into the asteroid's rock, connecting the external tower structure with the rest of the habitation zone via a warren of corridors. Several Organization gangsters were lounging around in the couches, drinking and talking as they were served by a non-possessed barkeeper. Three more gangsters were leaning against the long reception desk as a team of non-possessed cleaners worked to clear up the last of the trash left over from the Trafalgar victory party.

Kiera took it all in with a quick scan, trying not to let her tension show. She knew Capone's people wouldn't hassle

her on the way in. Getting out was something different altogether. All the gangsters had fallen silent, staring at her.

One of the exits led to a station serving Monterey's small metro tube network. It would be the quickest way of returning to the docking ledge territory she'd marked out as her own. But the carriages could be tampered with. Especially likely now they'd found Bernhard Allsop.

"We'll walk," she announced to her entourage.

They pushed through the tall glass doors and went out into the wide public hall outside. Nobody tried to interfere or block them. The few pedestrians in the hall gave them a wide berth as they marched along determinedly.

"How long until the hellhawks are refitted?" Kiera asked.

"Another couple of hours," Hudson Proctor said. He frowned. "Jull von Holger says the SD sensors have lost track of the *Tamaran*. It was on high-orbit patrol."

"Did the voidhawks kill it?"

"I never heard a death cry; neither did any of the other hellhawks. And ambushing our ships would be a big change of policy for the Edenists."

"Run an SD sensor check on the other patrol hellhawks, make sure they're still with us." Kiera let out a disgusted breath. Another complication. She didn't like to think about the hellhawks defecting to the Edenists. Their offers of refuge were still pretty constant from what Hudson, Jull, and the other affinity-capable told her. The only other alternative—that Capone had finally repaired a nutrient fluid refinery—was even worse.

A few metres in front of her, a non-possessed shambling along behind a trolley loaded with food suddenly veered across the hall. Annoyed, she stepped sideways to avoid the wayward trolley. The man pushing it was a wreck, unshaven, his grey jump-suit crumpled and dirty, oily hair smeared across his brow. A haggard face was screwed up in an expression of total anguish. She'd paid him no attention,

just like all the other non-posessed she encountered in Monterey, because his mind was a standard jumble of misery and fear.

He opened his arms wide, and grabbed her in a fierce bear hug that turned into a rugby tackle. "Mine!" he howled. "You're mine." They crashed painfully to the floor, Kiera's knee cracking against the carbon-concrete. "Darling, baby, Marie, I'm here. I'm here."

"Daddy!" She didn't say it. The voice came from within, rising irresistibly from Marie Skibbow's imprisoned mind. Incredulity poured through Kiera's thoughts, smothering her own responses. Marie was sweeping back towards full control.

"I'm going to get her out of you, I promise," Gerald shouted. "I know how. Loren told me."

Hudson Proctor finally recovered from his shock, and leant over the squirming couple to grab Gerald's sleeve. He pulled hard, muscles reinforced by energistic strength, attempting to tear the deranged man free from Kiera. Gerald stabbed a small power cell against Hudson's hand, its naked electrodes digging deep. Hudson screamed as the excruciating bolt of electricity flowed across his skin. He lurched back in terror and pain, a bud of flame sizzling bright from his hand. Two of the bodyguards pounced on Gerald, trapping his legs and one arm. He bucked about frantically.

Kiera went skidding over the floor, barely aware of the disorderly scrum tumbling around her. Her limbs were starting to move in the way which Marie commanded, as the girl's thoughts expanded rapidly back along their old pathways. She concentrated on fighting the girl's re-emergence.

Gerald jabbed the power cell towards Marie's face, the electrodes halting millimetres from her eyes. "Get out of her," he raged. "Out! Out! She's mine. My baby!"

One of the bodyguards grabbed his wrist and twisted hard. Gerald's bone shattered. The power cell dropped to the

floor. Gerald screamed in fury. He slammed his elbow back with berserker strength. It caught the bodyguard in his stomach, doubling him up.

“Daddy!”

“Marie?” Gerald gasped, fearful with hope.

“Daddy.” Marie’s voice was dwindling. “Daddy, help.”

Gerald scabbled round desperately for the power cell. His cold fingers closed around it. Hudson Proctor landed on his back, and the two of them rolled over together.

“Marie!” He could see her beautiful face in front of him. Shaking like a dog coming out of deep water, hair fanning round.

“Not any more,” she snarled. Her fist smashed dead into Gerald’s nose.

Kiera slowly climbed to her feet, swaying slightly as long tremors clattered along her body. The bitch girl was back where she belonged, weeping at the centre of her brain. One of the bodyguards was curled up on the floor, clutching his abdomen, cheek resting in a small puddle of vomit. Hudson Proctor was hopping about, shaking his hand violently as if it was still on fire. A deep pock of blackened flesh above his knuckles was trailing smoke, filling the air with a disgusting smell. His eyes were shedding tears of pain. The remaining bodyguards were standing round Gerald, spoiling for trouble.

“I’m going to kill the bastard!” Hudson shouted. He kicked Gerald hard in the ribs.

“Enough,” Kiera said. She wiped a shaking hand across her forehead. Her tangle of hair stirred itself, straightening out and flowing back to its usual dark glossy arrangement. She looked down at Gerald. He was groaning faintly, fingers pawing weakly at his side where Hudson had kicked him. Blood was pumping out from his flattened nose. His thoughts and emotions were a discordant nonsense. “How the fuck did he get here?” she grumbled.

“You know him?” Hudson asked in surprise.

“Oh yes. This is Marie Skibbow’s father. Last seen on Lalonde. Which was last seen departing this universe.”

Hudson gave an uncomfortable flinch. “You don’t think they’re coming back, do you?”

“No.” Kiera glanced along the hall. Three of Al’s gangsters had emerged from the Hilton’s lobby to look at what was going on.

“We have to move. Get him up,” she told her bodyguards.

They grabbed Gerald under his shoulders and hauled him upright. His dazed eyes peered at Kiera. “Marie,” he pleaded.

“I don’t know how you got here, Gerald, but we’ll find that out eventually. You must really love your daughter to have attempted this.”

“Marie, baby, Daddy’s here. Can you hear me? I’m here. Please, Marie.”

Kiera bent her bruised knee, wincing at the lick of pain which the movement brought. She focused her energetic power around the joint, feeling it ease up. “Ordinarily, just working you over ready to receive a soul from the beyond would be punishment enough. But after all you’ve done, you deserve better.” She smiled, leaning in closer. Her voice became husky. “You’re going to be possessed, Gerald. And the lucky boy who wins your body is going to get me as well. I’m going to take him to bed, and let him fuck me any way he wants, as much as he wants. And you’re going to feel it happening the whole time, Gerald. You’re going to feel yourself fucking your darling daughter.”

“Noooo!” Gerald howled, shuddering in his captor’s grip. “No, you can’t. You can’t!”

Kiera slowly licked Gerald’s cheek, holding his head fast as he tried to squirm away. Her mouth arrived at his ear. “It won’t be Marie’s first perversion, Gerald,” she whispered smoothly. “I enjoy how hot this body gets when I use it to

perform my deviancies. And I have a lot of them, as you'll find out."

Gerald began a tormented wailing; his knees buckled. "It hurts again," he bumbled. "My head hurts. I can't see anything. Marie? Where are you, Marie?"

"You'll see her, Gerald, I promise I'll open your eyes for you." Kiera jerked her head at the bodyguards holding the wretched madman. "Bring him."

The office Emmet Mordden had claimed for himself was on the same corridor as the tactical operations centre. Its previous occupant, the Admiral commanding New California's SD network, had favoured striking colours for his furniture. The easy chairs were purple, scarlet, lemon, and emerald, while his curving desk was a perfect mirror. A continual holographic screen formed a narrow band circling the room half-way up the wall, showing a view out over a coral reef colonized by some xenoc species of aquatic termites. Emmet didn't mind, like all possessed he enjoyed the impact of strong colours, and found the ocean relaxing. Besides, there was a very powerful desktop processor which allowed him to track down most of the problems he was given, and he was close to the Organization's communication centre when a crisis hit—like five times a day. The admiral also had an excellent stash of booze.

When Al came in he gave the easy chairs a disapproving grunt. "I gotta sit in one of those? Je-zus, Emmet, don't you tell no one. I got an image around here." Al sat in the one nearest the desk and rested his fedora on its wide arm. He took a longer look round. Same as everywhere else in the asteroid. Trash piling up, food wrappers and cups, along with a pile of clothes in one corner waiting for the laundry. If anyone should have room service sorted, he expected it to be Emmet. Bad sign that he hadn't. But the brain boy had been busy in other ways. His desk was covered in those electric

calculation machines, all stitched together with glass wire. Picture screens lined the edge of the desk, standing on things like sheet music racks; the whole set up was hurried, just out of the workshop. “You been busy by the looks of things.”

“I have.” Emmet gave him a pensive look. “Al, I gotta tell you, I’ve wound up with more questions than when we started.”

“Figures.”

“First off, I checked the corridor cameras, and all the ones round about that area. They came to a big zero. I don’t know who killed Bernhard, but they definitely messed with the camera processors. The memories were deleted, someone used a codebuster against our protocols.”

“Emmet . . . come on, man, you know I don’t grab any of that shit.”

“Sorry, Al. Okay, it’s like the photos the cameras take are automatically locked inside a safe. Well, somebody cracked it, took the photos out, then locked it up again behind them.”

“Shit. So no pictures, huh?”

“Not in the corridor, no. So I widened the search and hunted through the cameras outside, the ones covering the ledge.” He tapped one of the makeshift screens. “Watch.”

A picture of the docking ledge sprang up. They were looking down on the airlock as it jetted air out to the stars. Two spacesuited figures stood watching it. One of them started bounding towards the open hatch. After a short interval, the other one followed him.

“Nothing happens for a couple of minutes,” Emmet said.

The image zipped with static, then the two spacesuits emerged from the airlock and carried on walking down the ledge.

“The footprint guys?” Al suggested.

“I think so. But I don’t think they’re part of Bernhard’s hit.”

“Sure they are. They didn’t holler about what happened.”

“They’re in spacesuits, so they’re not possessed. Look at it from their angle. They’ve just stumbled over the newly dead corpse of one of your senior lieutenants, and they’ve even got his blood on their boots. There’s no one else around they can point the finger at. What would you do?”

“Keep my mouth shut,” Al agreed. “Do you know who they are?”

“This is where it gets odd. I backtracked them; they came out of a hellhawk called *Mindori*.”

“Goddamn! Kiera’s people.”

“I don’t think so.” The camera memory played on, showing the two spacesuited figures getting into a small truck and driving it round to another airlock. “I couldn’t get a record off the cameras in this section either. So I don’t know what they got up to inside. But it was a different program which erased their memories, not the same one used in Bernhard’s hit.” One of the spacesuited figures re-emerged onto the docking ledge and loaded several trays of small packages onto the truck. It was then driven back to the *Mindori*. The figure eventually climbed back up into the hellhawk’s life support module.

“Kiera doesn’t use non-possessed to crew her hellhawks,” Emmet said. “And that guy was still on board when it took off. The other one must still be inside the habitat.”

“Je-zus. He’s walking around in here?”

“Looks that way. All we know for sure is that they’re nothing to do with Kiera.”

“But he could be the goddamn Confederation Navy. Some kind of assassin. Their version of Kingsley Pryor.”

“I’m not so sure, Al. Those boxes in the truck. I ran a search through our store’s inventory. It’s not exactly tight at the best of times, but there’s a lot of electronics I can’t account for. I can’t see the Confederation Navy breaking in here to steal a truck full of spare parts. That doesn’t make any sense.”

Al stared at the screen, which had frozen on the last image of the spacesuited guy stepping into *Mindori's* airlock. "All right, so we've got two separate things going on here. Kiera hits Bernhard, and a hellhawk helps someone steal our electrical stuff. The first one I can understand. But the hellhawk . . . Can you figure what it's doing?"

"No. But it's back here right now. We can just ask it straight out. *Mindori* docked on the ledge this morning. Kiera's got her engineering teams out there fitting it ready for a long-duration flight. Something else to consider: our defence network says another hellhawk has gone missing from its patrol. They're running a check on the rest to see how many are still there."

Al leaned back into the chair, and grinned happily. "They could be trying to break free. How long till that food factory they need is fixed?"

"Another week. Five days if we really hustle."

"Then hustle, Emmet. Meantime I'm going out to take a ride in Cameron. He can talk to the other hellhawks for me, without Kiera listening in."

Gerald's fractured thoughts slithered through a universe of darkness and pain. He didn't know where he was, what he was doing. He didn't really care. Flashes erupted from time to time as neurons made erratic connections, releasing bright images of Marie. His thoughts clustered round them like worshipful congregations. The reason for such adulation was slipping from him.

Voices began to impinge on his miserable existence. A chorus of whispers. Insistent. Relentless. Growing louder, stronger. They began to intrude on his vague consciousness.

A blast of white-hot pain put him in sudden, frightening contact with his body again.

Let us in. End the torment. We can help.

The pain changed position and texture. Burning.

We can stop it.

I can stop it. Let me in. I want to help.

No, me. I'm the one you need.

Me.

I'm have the secret to end their torture.

There was sound. Real sound, rattling through the air. His own thin screams. And laughter. Cruel cruel laughter.

Gerald.

No, he told them. No, I won't. Not again. I'd rather die.

Gerald, let me in. Don't fight.

I'll die for Marie. Rather that . . .

Gerald, it's me. Feel me. Know me. Taste my memories.

She said . . . She said she'd . . . Oh no. Not that. Don't make me, not with her. No.

I know. I was there. Now let me come through. It's difficult, I know. But we have to help her. We have to help Marie. This is the only way now.

Astonishment at the soul's identity crumbled his mental barriers. The soul roared through from the beyond, permeating his body; the energy it brought seething along his limbs, sparkling down his spinal column. Invigorating. New memories invaded his synapses, colliding with the emplaced recollections in cascades of sights, sounds, tastes, and sensation. It wasn't like before. Before, he'd been confined, shoved down to the very edge of awareness, knowing of the outside by the tiniest trickle of nerve impulses. A passive, near-insensate passenger/prisoner in his own body. This time it was a more equal partnership, though the newcomer was dominant.

Gerald's eyes opened, a flush of energistic power helping them to focus. Another application finally banished the terrible headache that had raged for so long.

Two of Kiera's bodyguards were smirking down at him.

“Who’s a lucky boy then,” one chortled. “Man, you are in for the shag of a lifetime tonight.”

Gerald raised a hand. Two searing spears of white fire flashed from his fingertips, drilling straight through the craniums of both bodyguards. Four souls gibbered their fury as they plunged back into the beyond.

“I have other plans for this evening, thank you,” said Loren Skibbow.

It had been a while since Al took a ride in his rocketship. Sitting in the fat green-leather couch on the hellhawk’s promenade deck made him realize just how long. He stretched out, putting his feet up.

“Where can I take you, Al?” Cameron’s voice asked from the silver tannoy grill on the wall.

“Just off Monterey, you know.” He needed a break, just a short time alone to get his head around what was happening. In the old days he would have just gone for a drive, maybe take a fishing rod with him. Golf, too, he’d played golf a few times; though not to any rules the Royal and Ancient had ever heard about. Just buddies fooling round on a fine day.

The view through the big forward window showed him the asteroid’s counter-rotating spaceport slipping away overhead as they leapt off the docking ledge. Gravity inside the cabin was rock steady. New California tracked in from the riveted steel rim around the window, a silvery half crescent, like the moon had looked on clear summer nights above Brooklyn. He never could get used to how much cloud planets had. It was amazing anyone on the surface ever saw the sun.

Cameron was curving out from the big asteroid, rolling continually like a playful dolphin. If Al looked back through the portholes down the side of the promenade deck, he could see brilliant sunlight sweeping over the yellow fins and scarlet fuselage.

“Hey, Cameron, can you show me the Orion Nebula?”

The hellhawk’s antics slowed. Its nose swung across the starscape, hunting like a compass needle. “There we go. Should be dead centre in the window now.”

Al saw it then, a delicate haze of light, like God had wet his thumb and smeared a star across the canvas of space. He sat back in the couch and drank cappuccino from a tiny cup as he looked at it. Weird little thing. A fog in space, Emmet said. Where stars are born. The Martians and their death rays lived on the other side.

There was no way he could get his head round that. The idea of the Navy ships going there had frightened Kiera, and even Jez was concerned. But it didn’t connect for him. He was going to have to ask for advice again. He sighed, acknowledging the inevitable. But there were some things he could still take care of by himself. Chicago had more territories, factions and gangs than the whole Confederation put together. He knew how to manipulate them. Make new friends, lose old ones. Apply some heat. Bribe, blackmail, extort. Nobody today, living or dead, had his kind of political experience. Prince of the city. Then, now, and always.

“Cameron, I want to talk to a hellhawk called *Mindori*, and I want it confidential.”

The sharply pointed scarlet nose began to turn, sending the nebula sliding from view. Monterey reappeared, a grubby ochre splodge with pinpricks of light shimmering around its spaceport.

“The guy’s name is Rocio, Al,” Cameron said.

A square in the corner of the window turned grey, then swirled into a face. “Mr Capone,” Rocio said politely. “I’m honoured. What can I do for you?”

“I don’t like Kiera,” Al told him.

“Who does? But we’re both stuck with her.”

“You’re hurting me, Rocio. You know that’s bullshit. She’s got you by the short and curlies because she blew up

all your food factories. What if I told you I might be able to rebuild one?"

"Okay, I'm interested."

"I know you are. You're trying to set one up yourself. That's why you grabbed those electric gadgets the other day, right?"

"I don't know what you're talking about."

"We got it all on film, Rocio; your guys breaking in to Monterey and driving a truckload of stuff back to you."

"I was docked for a routine maintenance overhaul, some replacement components were fitted, so what?"

"Want me to check on that with Kiera?"

"I thought you didn't like her."

"I don't, that's why I came to you first."

"What do you want, Mr Capone?"

"Two things. If your factory doesn't work out, come and talk to me, okay? We can arrange much better terms than Kiera's giving you. No rumbles, for a start. You hellhawks just keep a look out for us around New California. That long-range sight of yours is a valuable commodity. I respect that, and I'm prepared to pay you the top-dollar price for it."

"I'll consider the offer. What's the other thing?"

"I want to talk to the guy who saw the murder. That was a good friend of mine got whacked. I got some questions about it for your guy."

"Not in person. He's useful to me, I don't want him taken away."

"Hell no. I know he ain't a possessed. I just wanna talk, is all."

"Very well."

Al sat drinking the rest of his coffee for a minute, trying to display patience. When Jed's sullen suspicious face finally appeared he laughed softly. "I'll be goddamned. How old are you, kid?"

"What do you care?"

“I’m impressed, that’s why. You got balls, I’ll say that for you, kid. Waltzing straight into my headquarters and stinging me for a hundred grand’s worth of electrical garbage. That’s the kind of style I like. Ain’t many in this universe would have done that.”

“Didn’t have any choice,” Jed grunted.

“Hell, I know that. I grew up in a tough neighbourhood myself. I know how it works when you’re on the bottom of the pile. You gotta show the boss you can take the heat, right? If you can’t take it, you ain’t no use to him. You get kicked out, because there’s always some other wiseass who thinks he can do better.”

“Are you really Al Capone?”

Al ran his hands down his jacket lapel. “Check out the threads, sonny. Nobody else got my class.”

“So what do you want to talk to me for?”

“I need to know things. Now, I can’t offer you much in return. I mean, you ain’t too keen to come visit me in person. I can appreciate that, so I can’t give you no reward; dames, booze, that kind of thing. What I got plenty of is local currency. You heard about that?”

“Some kind of tokens?”

“Yeah. Tokens, backed up by my word. If I say you owe somebody something, then you have to pay. So I’ll owe you three favours. Me, Al Capone, I will personally go into debt to you. That’s bankable on any possessed planet. Now you can’t ask for stuff like world peace, or crap like that. But any service or help you need, it’s yours. Think of it as the ultimate insurance. I mean, us possessed, we’re spreading through this universe. So, you game?”

It wasn’t a smile, but the sullen scowl had gone. “Okay, what do you want to know?”

“First off, that other guy with you, the one you left behind. Is he here to kill me?”

“Gerald? Christ, no. He’s ill, real bad.” Jed brightened.

“Hey, that’s my first favour. His name is Gerald Skibbow, and if you find him, I want you to bung him in a proper hospital with real doctors and stuff.”

“Okay. This is more like it, we got a dialogue here, you and me. Okay, Gerald Skibbow. If we find him, he gets good medical care. Now the other thing is, I want to know if you saw anyone else hanging around in that corridor when you found the corpse.”

“There was one bloke, yeah. I saw him through the glass in the door. Didn’t see much of him. Got a long nose. Oh, and really thick eyebrows. You know, the kind that meet over your nose.”

“Luigi,” Al growled. I should have known he’d side with Kiera. Disciplining people always sparks off a shitload of resentment. He’s going to have contacts among the fleet officers, too, a lot of contacts. She’ll love that. “Thanks kid, I still owe you a couple of favours.”

Jed gave an exaggerated nod. “Right.” His image faded out.

Al let out an infuriated breath. Partly angry at himself. He should have kept an eye on Luigi. It was this whole return setup. You couldn’t have a wiseguy whacked no more, because there was a good chance he’d come back somewhere on New California, and madder at you than when the beef started.

A wave of surprise and consternation flowed through the souls in the beyond, for once drawing Al’s attention. Something momentous was happening. Terror and awe at the event were the dominant sensations spiralling off from the relayed impression.

“What?” Al asked them. “What is it?”

Nothing like that first agonising blow against Mortonridge, thank Christ. When he concentrated on the slippery grey images fluttering from soul to soul he saw a sun with another sun erupting out of it. Space was filled with flame,

and death flooded inexorably across the sky like a storm-front.

Arnstat!

“Holy Christ,” Al gasped. “Cameron? You seeing this?”

“Loud and clear. I think the hellhawks swallowed out.”

“Don’t blame them.” Organization warships were vanishing inside blossoming shells of dazzling white light.

The Confederation Navy had answered Trafalgar in a way he had never dreamed they would. Brute force on an irresistible level. His warships were helpless. Their precious antimatter useless. “Don’t they understand?” he asked the desperate souls. “Arnstat will go.”

Already flashes of joy were cutting through the beyond as a multitude of bodies were proffered for possession. The reality dysfunction around Arnstat began to strengthen as more and more possessed added themselves to its gestalt. With the Organization’s orbital weapons falling to earth in a rain of smoke there was nothing left to prevent them.

“Cameron, get me home. Fast.”

He knew what would happen. The Confederation Navy would visit New California next, its imminent arrival presenting Kiera with her main chance. This time the lieutenants and soldiers would most likely listen when she told them they should return to the planet.

A bad day getting worse.

The hostage families of the starship crew members were held on several floors of a hotel overlooking Monterey’s biosphere. During the day, they gathered together in the building’s lounges and public areas to provide each other with whatever mutual comfort they could muster. It wasn’t much. They had become a weary crowd surviving each day on shattered nerves: barely fed, denied information, ignored and despised in equal measure by their Organization guards.

Silvano and the two gangsters ushered Kingsley into the

hotel's conference suite. He saw Clarissa immediately, helping serve the morning meal. She caught sight of him and cried out, dropping her serving spatula into the pan of beans. Everybody watched as they embraced.

She was overjoyed to see him. For the first minute. Then Kingsley could stand the dishonesty no longer, and confessed what he had become. She stiffened, backing away in anguish. Wanting to block out the words, for them never to have been spoken.

"How did it happen?" she asked. "How did you die?"

"I was in a starship. There was an antimatter explosion."

"Trafalgar?" she whispered. "Was it Trafalgar, Kingsley?"

"Yes."

"Oh dear God. Not you. Not that."

"I have to know something. I'm sorry I'm not asking about you—I should be, I guess—but this is the most important thing in the universe right now. Do you know where Webster is?"

She shook her head. "They keep us apart. He was assigned to the kitchen staff by that fat collaborator bastard Octavius. I used to see him every week. But it's been over a fortnight since they brought him last. None of them will tell me anything." She broke off at the strange smile rising on Kingsley's face. "What is it?"

"He was telling the truth."

"Who?"

"I was told that Webster had gotten away from the Organization, that he was on a starship. Now you tell me you haven't seen him, and Capone can't find him."

"He's free?" The knowledge overcame her reluctance, and she reached out to touch him again.

"It looks that way."

"Who told you?"

"I don't know. Someone very strange. Clarissa, believe

me, there's a lot more going on in this universe than we realised."

Her smile was tragic. "I can hardly doubt my dead husband."

"Time to go," he said abruptly.

"Go where?"

"For you, anywhere but here. Capone owes me that, but I suspect I might have trouble trying to collect. So we'll just take this one stage at a time."

He walked over to the conference suite's door, Clarissa following timidly behind him. The two gangsters lounging by the door straightened up as he approached; Silvano had disappeared, and they didn't know what they were supposed to do.

"I'm leaving now," Kingsley said in a smoothly reasonable tone. "Be sensible. Move aside."

"Silvano won't like this," one said.

"Then he should tell me in person. It's not your job." He concentrated on the door, visualising it swinging open.

They tried to prevent it, focusing their own power on keeping it shut. A black magic version of arm wrestling.

Kingsley laughed as the door crashed open. He looked from one gangster to the other, eyebrow arched in mocking challenge. Unopposed, he stepped through, and took Clarissa's hand.

Behind him, one of the gangsters picked up an ivory telephone and dialled furiously.

Gerald walked cautiously along the corridor, pausing by each door to discover if anyone was inside. It took a lot of Loren's attention just to make sure his legs moved in a regular motion. The state of his mind had horrified his wife; thoughts disjointed, personality retarded to a childlike confusion, memories becoming fainter and difficult to recall. Only his emotions remained at their adult strength, unmolli-

fied by reason and consideration. They pummelled what was left of his rationality with the sharp peaks of extreme states. He experienced fear, never mild anxiety; shame not embarrassment.

She was constantly having to calm and soothe, offering the kind of persistent encouragement longed for by every child. Her presence was a comfort to him, he kept talking to her, a stream of consciousness drivel she found highly distracting.

He was in bad physical shape, too. The crude injuries Kiera's goons had inflicted were easy enough to heal with energistic power. But his body remained perpetually cold, and there was a nasty sharp ache behind his temples which even energistic power couldn't banish entirely. What he needed was a week of proper sleep, a month of good meals, and a year on a psychiatrist's couch. It would have to wait.

They were somewhere inside the docking ledge spaceport which Kiera had taken over for herself and her fraternity. Cabal Centre. Except it was virtually deserted. Apart from the two goons she'd killed, she'd seen only three other possessed. None of them had paid her any attention, hurrying along with fraught minds to obey whatever orders they'd received. The lounges and halls were all empty.

Loren entered the main lounge, almost familiar with the bland decorations and subdued furniture. She'd seen this place often enough from the beyond. Kiera's haunt.

Gerald's hand ran over the woolly fabric of the couch. Marie had sat on it for hours, talking to her fellow conspirators. The coffee machine; she'd had that brought in along with fine china. It was bubbling away, filling the lounge with its aromatic scent. His eyes moved fast across the door to her bedroom. The men she'd taken in there.

Loren tried asking the souls of the beyond where she was. But the agitation and unrest created by Arnstat was snarling up their bitter cacophony even more than usual. There were

some glimpses of a female shape. Possibly her. Running with a group of people along an unknown corridor.

The face was less like Marie's than it used to be.

Loren swore viciously. To have come this far. She and Gerald enduring horrors greater than anyone knew existed. To have prevailed through all that. To be *so* close. Whatever omnipotent entity had designed the beyond must surely have come up with the concept of fate as well.

She could feel Gerald starting to crumple in utter dismay as the prospect of reclaiming their daughter started to recede once again. It will not happen, she promised him.

As she moved across the lounge she saw a hellhawk on its pedestal outside. Gerald's surprise halted her as he recognised the *Mindori's* naked form. Platforms and mobile gantries were ranged up against its cargo holds, each one surrounded by bright floodlights. Maintenance crews in sleek black SII spacesuits were installing bulky equipment modules, mating their power and coolant lines to the spacecraft's existing utility points. Though she couldn't understand any of the activity, Loren was confident they now had an escape route when the time came. Providing that time was soon.

She left the lounge and descended one level. This was the engineering section, though none of its workforce had spent much time on internal upkeep recently. Lightpanels along the corridor roof were a feeble yellow; a few of the air ducts buzzed irritably as they blew out erratic streams of air, but most were still. The only clue it wasn't entirely abandoned came from a near-subliminal humming thrown out by heavy machinery. Loren swivelled round trying to guess the direction, curious about what could be functioning at such a pace when nobody else was around.

When she finally located the guilty door and opened it, she emerged into a vast maintenance shop that had been converted into a cybernetic factory. Rows of industrial ma-

chinery were pounding away with furious intent, hammering, drilling, and cutting components out of raw metal. Crude conveyer belts had been set up between them, carrying the freshly minted chunks of metal to assembly tables at one end. Over two dozen non-possessed workers were employed building machine guns. They were stripped to the waist, their skin gleaming with sweat from the unfiltered heat given off by the machinery.

None of it really registered with Gerald, while Loren looked round in complete confusion. She walked over to one of the non-possessed workers.

“Hey! You. What the hell are these for?”

The man looked up in shock, then bowed his head. “They’re guns,” he grunted sullenly.

“I can see that, but what are they for?”

“Kiera.”

It was all the answer she was going to get from him. Loren picked up one of the guns, her hands slipping on the fine spray of protective oil. Neither she nor Gerald knew much about weapons outside of a didactic course they’d both taken to handle the laser hunting rifle they were allowed on the homestead. Even so, this looked strange. She watched one being put together. Its firing mechanism was too large, and the barrel was lined with some kind of composite.

Memories which belonged to neither of them foamed away behind Gerald’s eyes. Memories of mud and pain. Of dark humanoid monsters armed with blazing machine guns, advancing with deadly inexorability out of the grey rain.

Mortonridge. Kiera was building the kind of weapons the Confederation had used at Mortonridge. Against the possessed!

Loren looked round the factory again, thoroughly unnerved by what she was seeing. The production rate must run into hundreds a day. She was surrounded by non-possessed

churning out the one weapon that could blast her back to the beyond in a second. If they had any ammunition.

She checked over the gun she was holding, wiping off the surplus oil with a tissue. Satisfied it was fully functional, she left the factory and started hunting for the second one. It wouldn't be too far away.

Monterey was twenty kilometres away; Cameron's approach made it look as though the asteroid was moving to eclipse New California. Sliding across the crescent as it expanded in the promenade deck's big window. The flight path, coming in at ninety degrees to the rotation axis made it look as though the rock was sprouting a glittery metallic mushroom straight up. That changed as Cameron curved round above the counter-rotating spaceport, and started to slide in parallel to the spindle. The docking ledge was directly ahead, a deep circular gully chiselled into the rock, with tiny brilliant lights on one side producing wide circles of illumination on the other. Orientation shifted again as the hellhawk chased the asteroid's rotation, turning the gully sides to a floor and ceiling. And Al finally began to understand the way centrifugal force worked.

An explosion bloomed out of the cliff-face rear of the ledge, quarter of the way round from Cameron's position. It came from a section of rock that was clad in a big mosaic of metal and composite equipment. A broad fountain of brilliant white gas, moving sluggishly enough to be a liquid, spitting out from a jagged hole at the centre of the machinery. Tiny chunks of solid matter spun through the plume.

Al took the Havana from his mouth and crossed over to the window, pressing against it for a better look. "Holy shit. Cameron, what the hell was that? Is the Navy here already?"

"No, Al. There's been a breach in the rock. I'm monitoring the radio, nobody's quite sure what happened."

“Where did it happen?” Al was straining to see if there were any hellhawks or people on the ledge near the plume.

“It’s in an industrial sector, where you were repairing that nutrient fluid refinery.”

Al slammed the palm of his hand into the window. “That *bitch!*” His three small scars were snow-white against a burning cheek. He stared at the plume as it slowly died down, exposing the crumpled wreckage that was peeling away from the vertical rock. “Okay, a straight fight is what she wants, that what she gets.”

“Al, I’m picking up a broadband message to the fleet. It’s Kiera.”

One of the small circular ports along the side of the observation deck shimmered over and began showing Kiera’s face. “. . . after Arnstat there can be no alternative. The Confederation Navy is coming, and with the numbers to defeat us. Unless you want to be banished back to the beyond, we have to transfer ourselves down to the planet. I have the means to do this, and the ability to maintain our authority on the surface without relying on the SD platforms and anti-matter. Everything you have now, your status and position, can be continued under my patronage. And this time around you don’t have to risk yourselves on those dangerous war missions of Capone’s. His day is over. For those of you who choose to have a privileged future, get in touch with Luigi, he will be joining you in the *Swabia*. If you follow him to low orbit, I will provide the means to establish yourselves on the surface. Anyone who wants to stay and wait for the Navy, feel free.”

“Damnit.” Al picked up the black telephone. “Cameron, get me Silvano.”

“He’s there, boss.”

“Silvano?” Al yelled. “You hearing Kiera?”

“I hear her, boss,” the lieutenant’s voice crackled.

“Tell Emmet he’s to stop any ship that doesn’t stay where

it is any way he God damn can. I'll talk to the fleet myself later. And I want that fucking message closed down. Now! Send a bunch of our soldiers to surround her headquarters, don't let anybody out. I'm gonna come and deal with her personally. Tonight she starts sleeping with the fish."

"You got it."

"I'll be docking any minute. I want you and some of the guys there to meet me. Loyal ones, Silvano."

"We'll be waiting."

Luigi arrived at the base of the docking spindle feeling pretty damn good. The waiting and plotting had been getting to him, too much like sneaking around in the dark. He was an out-in-the-open kind of guy. Kiera had insisted he keep a low profile: he was still running round after that nobody Malone down in the gym, shovelling shit for non-possessed. The times when he got out to meet his old friends flying the Organization warships were few and far between, and at the meetings all he did was drop a few words of sedition, plant the seeds of doubt.

Every time he'd go back to Kiera and assure her the fleet was losing patience with Capone. Which was so. But he hyped the figures a little, carving himself a bigger slice.

Now that didn't matter any more. He'd walked out of Malone's cruddy basement as soon as Arnstat registered, not even waiting for Kiera's call. This was it, their chance. Once he was back out there with the fleet, all those numbers wouldn't mean shit. They'd follow him again, he knew it. He'd always been good with his lieutenants, they respected him.

The big transfer chamber at the axial hub was almost deserted when he came out of the tube. He air-swam over to the doors for the commuter cabs.

A man and a woman glided across to him. It annoyed Luigi, but this wasn't the place to make a scene. Ten min-

utes, *ten*, and he'd be back inside a starship again, in command.

"I remember you," Kingsley Pryor said. "You were one of Capone's lieutenants."

"What's it to you, pal?" Luigi snapped back. He'd never been able to live with the nudges and whispers which followed him everywhere, like he was some kind of child molester on the run.

"Nothing. Are you going out to a ship?"

"Yeah. That's right." Luigi looked away, maybe the dumbass would catch on.

"That's nice," said Kingsley. "So are we."

The doors opened, revealing the commuter cab's empty interior. Kingsley gestured politely. "Please, you first."

After she showered, Jezzibella marched along the side of the bed, inspecting each of the dresses Libby had laid out. The problem was, none of them were new. She'd gone through her whole wardrobe since she hooked up with Al. *I need new clothes*. It had never been a problem when she was touring. Clothes were such a minuscule part of the tour budget that the company never quibbled when she bought a new range on every planet—not that she had to. Each fresh star system was colonized by hot young designers who'd kill for her to be seen just looking at their labels.

She sighed and reviewed the lineup again. It would have to be the blue and green summer dress with its wide shoulder straps and micro-skirt. Worn over the girlishly sympathetic persona.

The tiny dermal scales began to contract and expand in response to the sequence she keyed in, performing their minute adjustments to her baseline facial expression so that she appeared perpetually intrigued and trusting. Skin texture softened to a young, healthy glow. Twenty-one all over again.

Jezzibella went over to the angled mirrors on the dressing table to check herself over. The eyes weren't right; they were too rigid, insufficiently awed and excited by the beautiful mysterious world they explored. A little piece of the tough executive persona hanging on past its sell-by date. She scowled at the offending patches; the dermal scales were degenerating again. It was always the areas around the eyes which wore out first. Her supply of replacements was none too high, either. Not even a planet could make up that shortfall; her stocks had always come straight from Tropicana, the one Adamist world with relaxed bitek laws.

"Libby," she shouted. "Libby, get in here and bring that package with you."

The old dear had worked wonders recently, patiently reapplying the scales with a true artisan's touch to gloss over the reduced coverage. But even her magic couldn't last forever without new scales. Jezzibella didn't want to consider that.

"Libby, get your arthritic ass in here right now!"

Kiera, Hudson Proctor, and three goons stepped into the bedroom, passing straight through the door without opening it as if the clanwood panels were nothing more than coloured air. All five of them were cradling static bullet machine guns.

"Showing our age, are we?" Kiera asked silkily.

Jezzibella clamped down on her shock and budding fear. Kiera would be able to see that, and she wouldn't give her the satisfaction. Her mind slipped directly into the cool empress persona without any help from her crashed neural nanonics. "Here for some beauty tips, Kiera?"

"This body doesn't need any. It's a natural. Unlike yours."

"Pity you don't know how to use it properly. With breasts like those I could have ruled the galaxy. All you have is twenty male morons whose hard-ons have drained the blood

from their brains. You can't inspire them, you're just their whore. What a force not to be reckoned with that makes."

Kiera took a step forward, her serenity cooling rapidly. "That mouth of yours has always been a problem for me."

"Wrong again, it's the smarter brain behind it which beats you every time."

"Kill the slut," Hudson Proctor barked. "We don't have the time for this. We've got to find him."

Kiera lifted her machine gun up and touched the tip of the barrel lightly against the base of Jezzibella's neck. Watching closely for a reaction, she slid the barrel down, teasing open the thick white robe. "Oh no," she murmured. "If we kill her, she'll just come back as our equal. Won't you?"

"I'd have to lower myself a long way before I reached that point."

Kiera had to put an arm out to restrain Hudson Proctor. "Now look what you've done," she chided Jezzibella. "These are my friends you're upsetting."

Jezzibella's expression was of complete amusement. She didn't even have to speak.

Kiera nodded a reluctant submission to the private sparring. She gently shifted the towelling robe back to its original state. "Where is he?"

"Oh, please. At least threaten me."

"Very well. I will not allow you to die. And I do have that power. How's that?"

"For fuck's sake," Hudson Proctor said. "Give her to me. I'll find out where he's gone."

Kiera gave him a pitying glance. "Really? Will you gang bang her into capitulation, or simply keep on hitting her until she tells you?"

"Whatever it takes."

"Tell him," Kiera said.

"If I thought you could win, I would have joined you at the start," Jezzibella said simply. "You can't, so I didn't."

“The game has changed,” Kiera said. “The Confederation Navy has destroyed our ships at Arnstat. They’re coming here. New California has to leave, with us on it. And the only thing stopping that is Capone.”

“Life’s a bitch, death’s a tragedy, then you meet me.”

“One of your better lyrics. Too bad you won’t be remembered for it.”

The processor block Jezzibella had left on the dressing table began to shrill an alarm.

“Right on time,” Kiera said. “That’ll be my team dealing with Capone’s refinery. I’m covering my back in case he subverts any of my hellhawks. Not that I actually have to blast him back into the beyond in person. One of my sympathisers has already been given that job. But I was so looking forward to being there. So once again, you’ve spoilt my fun.” She held a finger up. A long yellow flame flared from the tip, dancing in front of Jezzibella’s stoic face. “Let’s see if I was wrong about being unable to force you, shall we? After all this effort I think I deserve some kind of payoff.” The flame turned blue, shrinking until it was a small fiercely hot jet.

Life in Emmet Mordden’s office had suddenly become very hectic. One set of screens was covering the explosion in the nutrient fluid refinery, providing images from surviving cameras and sensors along with a general schematic of the section. Whoever placed the bomb knew what they were doing. It had taken out a huge segment of the outer wall, crumpling the internal machinery and cutting power and data cables. Depressurisation had damaged the refinery still further, rupturing pipes and synthesiser modules. At least there were no fires, the vacuum made sure of that.

Emmet was busy coordinating with the project manager, trying to ensure that everyone who’d withstood the blast was safe behind pressure doors or in emergency igloos, as

well as doing a body count. Medical teams were on their way.

The SD sensor grid was splashed across the largest screen, with a full tactical overlay. It showed the long range sensor focus sweeping the high-orbit vectors which the hellhawks were supposed to be patrolling. Six were missing. The scans had also revealed two voidhawks swallowing in to take advantage of the gaps.

His analysis of the virus in Bernhard's block was still running, filling one holographic screen with cubist alphanumeric. He didn't even have time to suspend that.

Several questors from his desktop block were running through the asteroid's memory cores, hunting down references on Tyrathca military history and the Orion Nebula. Al had wanted to read up on them. So far they'd produced very few files. All of them on the soldier caste. None of which he'd accessed.

Kiera's face was smiling complacently out of another, her refined voice booming round the room, telling the fleet that they should turn their backs on Capone and emigrate down to the planet with her. The screen next to her was flipping through the asteroid's communication circuits, running a program to track down which antenna she was using and where her input entered the network.

The SD sensor network flashed up a priority-one alert. The *Swabia* had disengaged from its docking bay cradle and initiated a jump immediately. The assholes hadn't even cleared the rim!

His desktop block beeped urgently. "What?" Emmet yelled.

"Emmet, this is Silvano. I've got a message from the boss."

"I'm a little busy right now." He squinted at the display of the communication circuits. Sections were dropping out. Viral warnings started to appear.

“Get in to the control centre and make sure the fleet stays on duty. Anyone starts heading for the surface, nuke the fuckers with the SD weapons. Got that?”

“But . . .”

“Now, you pissant little mother.” The block went dead. Emmet snarled at it, the closest he’d ever come to showing disrespect to Al’s chilling enforcer. He took the time to load a couple of orders in the desktop to run a virus scan through the office hardware, and went out at a run.

The thick door to the control centre slid open. Jagged lines of white fire ripped through the air centimetres in front of Emmet. Alarms were screaming as red strobes burned down his optic nerves. Layers of smoke lashed out down the corridor. He squealed in panic and dived behind one of the consoles as he hardened a bubble of air around himself. Two fireballs burst open against its boundary. Instinctively he sent white fire of his own back along the direction they’d come from. It sizzled sharply in the torrent of purple retardant foam spraying out of the ceiling nozzles.

“What the fuck is going on?” he yelled. He could sense two distinct groupings of minds in the control centre, clustered at opposite ends of the chamber. Most of the consoles between them were smothered with foam that seethed and writhed as it absorbed the flames licking up from smoking puncture holes.

“Emmet, that you? Kiera’s bastards tried to shut down the SD network. We stopped them. Snuffed one.”

Despite the lethal environment, Emmet lifted one arm away from his head to glance round again. Stopped what? he thought incredulously. The centre was a total wreck.

“Emmet!” Jull von Holger called. “Emmet, tell your guys to pack it in. We’ve won and you know it. The Navy’s coming and it’s not taking prisoners. We have to get down the planet.”

“Oh shit,” Emmet whispered.

“Emmet, help us,” Capone’s faction called. “We can whip their asses.”

“Put a stop to it, Emmet,” Jull called. “Come with us. Be safe.”

The white fire was slashing faster, its brightness building. Emmet curled up tighter, trying to shut it all out.

The gleaming scarlet rocketship edged slowly over the docking ledge, creeping up to the pedestal positioned only sixty metres from the vertical wall of rock. It settled smoothly, and a metallic airlock tube telescoped away from the cliff face to search out the hellhawk’s hatch. They engaged and sealed.

Al Capone stomped along the tube into the reception lounge, a baseball bat gripped firmly in his right hand. His lieutenants were waiting for him, Silvano and Patricia grimaced but obviously spoiling for a fight. Leroy at their side, anxious and desperate to prove his loyalty. A semicircle of over a dozen more behind them, equally committed, dressed in their best pinstripe suits, Thompson machine guns gleaming and ready.

Al nodded round, pleased with what he saw. He would have preferred old friends, but these would do. “Okay, we all know what Kiera wants. The dame’s running scared of the Navy and that Ruski admiral. Well, now we’ve seen what those bastards will do when their back’s to the wall, I say that makes it more important than ever to stay here and cover our asses. We’ve still got antimatter, and lots of it. That means we got clout where it hurts, we can make them the offer. Unless the Feds agree to stop dicking around with us, every planet they got’s gonna live in fear from now on. That’s the only way to be sure. I’ve lived with being wanted all my life, and I know how to deal with that kind of bullshit. You never, fucking ever, let your guard down. You gotta make like you’re the meanest SOB on the street to stop them

messing with you. If they don't respect you, they don't fear you." He slapped the top of the baseball bat against his left palm. "Kiera needs to be told that in person."

"We're with you, Al," someone called.

The semicircle of gangsters parted, and Al strode forward. "Silvano, we know where she is?"

"I think she went to the hotel, Al. We can't get them on the phone. Mickey's gone back there to take a look. He'll call if he finds her."

"What about Jez?"

Silvano shot Leroy a glance. "We think she's still there, Al. Couple of the guys are there with her. She'll be fine."

"Better be," Al muttered. He looked ahead to see Avram Harwood III standing in the lounge's doorway. The man was a total tow truck job. Breathing badly, his unhealed wounds leaking cheesy fluid down pale damp skin; he could barely stand.

"I am the mayor," Avram wheezed. "I am entitled to respect. That's your big thing, isn't it, respect." He giggled.

"Avvy, get the fuck out of my way," Al snapped.

"Kiera showed me respect." Avram raised his static bullet machine gun. "Now it's your turn." The weapon's fire rate control was set at maximum. He pulled the trigger.

Al was already jumping out of the way. Silvano was raising his own Thompson. Leroy brought his arms up, yelling a frantic: "*No!*" at the top of his lungs. The other gangsters were diving to the floor or aiming at Avram.

Electrically charged bullets tore across the lounge, a devastating line of throbbing blue-white light complementing the dragon's roar. Al hit the floor just as the first possessed body ignited in its unique spectacular fashion. The searing glare wiped out everyone's vision. A shockwave of heat washed over them, blistering exposed skin, singeing hair. Another body ignited.

Al screamed in raw fury, flinging a white firebolt as

strong as the internecine furnace of flesh. Eight identical streamers of white fire smashed into Avram Harwood's body, vaporizing his torso instantly amid a bloom of ash and blood steam. Arms that had been held outstretched dropped to the melting carpet next to his collapsing legs. Heat detonated every chemical bullet left in the machine gun's magazine as it fell, sending out a lethal volley of shrapnel to slash walls and flesh.

When the light, heat, and noise shrank away, Al swayed to his feet. All he could see at first was a giant purple after-image which his energistic power was incapable of banishing. His weird psychic sense couldn't track down Avram Harwood's thoughts anywhere. As he blinked the blotches away from his eyes, he realized how badly parts of him were hurting. His suit and hands were running with blood from half a dozen wounds where the shrapnel had sliced into him. One by one he made the slivers of hot metal slide up out of his body and closed the lips on each cut, bonding the skin back together. The pain dwindled away.

Leroy was lying on the floor at Al's feet. Bullets had torn their way across him, the last one removing half of his throat. Dead eyes stared upwards. Al switched his gaze to the two piles of charcoal scattered over the molten composite floor tiling. "Who?" he demanded.

The gangsters were picking themselves up, healing and sealing their shrapnel wounds. A head count told Al that Silvano had been among the victims of the static bullets. Nobody dared say anything as Al stood over the small black pile of cooling ash that used to be his chief enforcer. His head was bowed as if in prayer. After a minute he walked over to the four battered limbs that remained of Avram Harwood. "Bastard!" Al screamed. He brought his baseball bat crashing down on an arm. "Motherfucking!" The bat slammed into the arm again. "Shit eating!" This time he hit a leg. "Psycho bastard!" The other leg. "I'll kill your family.

I'll burn your house to the ground. I'll dig up your mother's coffin and shit on her. You wanted respect? That what you wanted? This is the kind of respect I got for a cornholing son of a bitch like you." The bat pounded and pounded on the limbs, pulping them to roadkill smears.

Patricia stepped forward from the rank of badly alarmed gangsters. "Al. Al, that's enough."

The bat was brought up, ready to fly at her head. Al met her level gaze, stood for a moment with the bat poised. A long breath shuddered out of him. "Okay," he said. "Let's go find Kiera."

The floor under Emmet was melting, transmuting into a puddle of cold liquid rock. It would soon be deep enough to swallow him whole. Somebody was becoming very anxious to turn him into a fossil. He strove hard to turn the rock solid again as the air above him raged with white fire and profanities. The two factions were evenly matched, and both of them kept shouting at him to throw his strength in on their side.

He wanted to help Al's guys. His own side. Really wanted to. Except the idea of going with New California into a place of safety was hugely appealing. No more of this shit, for a start.

A voracious spout of white fire hit the console he was crouched behind, and started chewing its way through the composite casing and tightly packed circuitry cubes inside. Kiera's people obviously had decided he wasn't joining them.

Retardant foam gushed downwards, only to be catalysed into boiling green treacle by the unnatural blaze. It poured off the top of the console and splattered over Emmet, stinging his exposed skin. He drew a deep breath, praying his bladder would hold out, and conjured up a spear of white fire. It flashed across the chamber towards Jull von Holger and his cohorts. The immediate result wasn't quite what he expected.

A thunderous roar swamped the control centre. A possessed body ignited, forcing Emmet to clamp his hand over his eyes. The mental and vocal shriek of the vanquished soul grated down his skin like needles of ice. A second body erupted, then another. The air was clogged with stifling heat and a vomitous stench of incinerated meat as they belched out thick fumes.

After a long time the bodies burnt out, returning the light level to normal. The awful fetor remained. The roaring had stopped.

A loud metallic *snik* sounded across the chamber. To Emmet's ears it sounded mechanical, and very weapons orientated. Footsteps squelched through the foam.

"You've pissed yourself," a voice told him.

Emmet twisted his head out of the foetal position. A gaunt man in a grubby one-piece suit was looking down at him, holding a peculiar machine gun, its warm barrel pointing directly at Emmet's forehead. A canvas satchel was slung over his shoulder, packed full of magazines.

"I was scared," Emmet said. "I'm not part of the Organization's muscle."

The man's features vanished for a second, replaced by a woman's. If anything, her expression was even more forbidding. Emmet could sense the energistic power circulating through the body. It rivalled Al's strength.

Survivors from the Organization faction were peering nervously over the top of their trashed consoles.

"Who are you?" Emmet stammered.

"We are the Skibbows."

"Uh, right. Are you on Kiera's side?"

"No. But we'd really like to know where she is." The machine gun's safety catch was released. "Now, please."

Mickey Pileggi had learned the hard way not to try and storm Kiera and her goons. Three of his soldiers had wound

up burning like miniature suns when they all charged into the Nixon suite. Mickey had entertained visions of lavish praise and unlimited privileges heaped upon him by Al for rescuing Jezzibella from Kiera's hands. That dream had quickly turned into a crock of shit. The guns she was armed with had caused havoc amongst the gangsters. Those screams would echo through the air around Mickey for eternity.

He'd ordered them to fall back to the hallway outside, taking up shielded positions in the twin stairwells and disabling the elevators with strategic blasts of white fire. They were at the bottom of the tower. She wasn't going anywhere. Now he just had to explain to Al how he'd fouled up.

Another spray of static bullets hammered out from the splintered doors of the Nixon suite. All the gangsters ducked, thickening the local air.

"We should seal this floor off," one of them said. "Blow the windows out and see how she likes eating vacuum."

"Great idea," Mickey grumbled. "Are you gonna tell Al we did to Jezzibella what they did to Brown-nose Bernhard?"

"Guess not."

"Okay. Now come on, guys. Let's concentrate on making those doors evaporate. Keep them occupied defending themselves while our reinforcements arrive."

"If any do."

Mickey shot the man a furious glare. "Nobody's deserting Al, not after what he's done for us."

"For you."

Mickey didn't see who said that, but let the sharp anger show amid his thoughts as a warning. He focused on the door, and punched it with the force of his mind. Bullets pulverised a line in the marble wall above his head. Tiny tendrils of electricity scabbled across the surface. Everyone flinched down fast.

His processor block beeped. He dusted hot marble chips from his hair and pulled it out of his pocket, amazed the thing was working with so much machismo energetic power buzzing about.

“Mickey?” Emmet implored. “Mickey, you got any idea where Kiera is?”

“Pretty sure, yeah. She’s like ten yards away from me.” Mickey gave the block an infuriated look as Emmet abruptly cut the call. “Okay guys, let’s hit the doors together this time. On three. One. Two—”

The office door shut behind Skibbow, and Emmet let out a *huge* gasp of relief. There was a real monster of a problem torturing that wacko possessed, and Emmet was enormously glad he didn’t share any part of it. He let his body calm for a few precious moments more, then called Al.

“Whatcha got for me, Emmet?”

“We had a problem in the SD control centre, Al. Kiera’s people tried to knock out the orbital platforms.”

“And?”

“They’re sleeping with the fish.” He held his breath, worried Al could sense half-truths along the communication circuit.

“I owe you one, Emmet. I won’t forget what you did.”

Emmet’s fingers were skidding fast over his desktop keyboard, re-routing the SD network’s main command channels. Symbols blinked up on the tactical display, showing him what he was in charge of. He smiled uneasily at the power he’d assumed. Lord of the sky, admiral of the fleet, enforcer of order across a whole planet. “The place is pretty much a bombsite, Al, but I’ve still got control of the major hardware.”

“What’s the fleet doing, Emmet? Are the guys staying put?”

“Pretty much. Eight frigates are heading down to low

orbit, I guess the rest are waiting to hear what you've got to say. But Al, I count seventeen hellhawks missing."

"Je-zus, Emmet, first chunk of good news I've had today. You keep watching everybody, make sure they don't move. I got some business to clear up, then I'll be right back with you."

"Sure thing, Al." He blinked, and squinted at the tactical display. It wasn't supposed to be shown on such a small scale; this was a format designed to showcase across a hundred metre screen in front of admirals and defence chiefs. From what he could make out, two miniaturised symbols were moving very close to Monterey itself.

The *Varrad* skimmed above the wrinkled rock, keeping a constant fifty-metre separation from the pumice-like terrain, lifting and sinking in perfect curving parallels with the craters and ridges beneath its metallic lower hull. Pran Soo was pursuing the Hilton tower as it slid across the stars, closing on it like an atmospheric fighter on a low-visibility strike run. Along with all the other hellhawks, she'd been monitoring what communications she could access since Kiera's revolt had started. And Mickey Pileggi had spent fifteen minutes yelling across the net at his fellow Organization lieutenants for help to deal with Kiera and her dangerous weapons.

Are you sure about this? Rocio asked.

Absolutely. We know a possessed body is incapable of defending itself against a starship weapon. The power level is simply too great, even if they know they're being targeted. I can eliminate Kiera with one shot, and this time there will be no comeback from the Organization. We will truly be free.

Capone's girlfriend is in that hotel suite.

He will find another. We will never have an opportunity like this again.

Very well, but try to keep the destruction to a minimum. We may yet have to cut a deal with the Organization.

Not if the Confederation Navy gets here first.

Let me see what's happening. The rock is blocking my distortion field.

Pran Soo opened her affinity, allowing him to borrow the sights revealed to her bitek sensor blisters, showing him the rock rushing past her hull. Her other principal sense, the *Varrad's* distortion field, was reduced to a hemispherical shape, its usual bloated coverage curtailed by the giant asteroid.

The Monterey Hilton swung towards her, sticking out proud from the rock. Visually, a pillar of tough carbon-reinforced titanium riddled with thick, multi-layered windows. Inside the distortion field it emerged as a coagulation of thin sheets of matter, threaded with a filigree of minute power cables whose electrons were imbued with a delicate spectral sheen.

She matched her vector with the asteroid's rotation. Electronic pods on her hull flowered, thrusting out sensors. They swept across the lower floors of the tower.

I can't distinguish individual people, she told Rocio. The window's radiation shielding is an effective block against precision scanning. I am aware of their emotions, but from this distance they've blurred together. All I know is, several people are definitely in there.

And Mickey Pileggi is still calling for assistance. Kiera must be one of those you sense.

Pran Soo activated a microwave laser, and aligned it on the base of the Hilton. The beam would slice along the side of the tower, filleting the structural girders so the entire bottom floor would tumble away into interplanetary space. Targeting systems designated the requisite cutting pattern.

A hellhawk rose above the asteroid's flat horizon behind

Pran Soo, its hull crawling with vivid lines of electrical energy feeding a comprehensive armament of beam weapons.

Etchells, Pran Soo exclaimed in surprise.

Two masers punctured her thick polyp hull, penetrating right into the central core of organs.

Emmet finally managed to shift the tactical display's magnification, enhancing the zone around Monterey itself. He was just in time to watch one of the symbols drift away from the Hilton tower. The other symbol moved in closer to the hotel. Its data tag identifying it as the *Stryla*, which he knew was possessed by Etchells. But he didn't have a clue whose side it was on, even if the hellhawks were taking sides.

He activated the close-range defence systems and ordered them to target the hellhawk. The only option, given SD's hellhawk liaison guy was now a mound of ash in the ruined control centre. Etchells was an unknown factor, capable of killing possessed humans. And AI was heading down into the Hilton.

Stryla's symbol sprouted a small batch of alphanumeric, telling Emmet it was datavising directly to the asteroid's SD command. He hunted round his program menus, desperately trying to route the message through to his office.

"Disengage your targeting lock," Etchells said.

"No way," Emmet told him. "I want you a thousand kilometres away from this asteroid; you have thirty seconds to begin accelerating or I'll fire."

"Listen, bollockbrain. I have fifty combat wasps in my launch cradles, all with innumerable submunitions, all fitted with fusion warheads. Right now, they are all armed, and activated by a deadman code. You cannot train enough beam weapons on me to vaporise me and the missiles instantaneously. If you fire, they will detonate. I'm not sure if that much megatonnage will crack Monterey open or not. Would you like to find out?"

Emmet's hands clamped round his head in an agony of frustration. I am not cut out for any of this shit. I want to go home.

What would Al do? It wasn't such a good question. He had the horrible feeling that if you put Al in a Mexican stand-off he would shoot.

"You know, I might just," he said stubbornly. "I've had a real shitty time today, and the Confederation Navy is on the way to make it worse."

"I know the feeling," Etchells said. "But I'm really not a threat to you."

"Then what the hell are you doing there?"

"I have to ask someone a question. Once I've done that, I'll leave. Give me five minutes, then you can start acting tough again. Deal?"

The expensive designer gloss had departed from the lounge in the Nixon suite. Mickey's ill-judged attempt to beachhead the place had resulted in streamers of white fire slashing round in chaotic violence, and Kiera's counter-attack had only made it worse. The lights were out, a tangle of broken pipes and cables hung down out of the ceiling, the furniture had burned enthusiastically and was now reduced to smoking embers. Torrents of energetic power poured upon the doors by both sides had turned them and the surrounding walls into a fantastic tract of heterogeneous crystal; long encrustations of quartz sprouted in jumbled antagonism, each branch fighting its neighbour like a forest of avaricious jewels. They writhed fluidly each time another burst of power doused them, growing slightly longer and more entwined.

Kiera worried that the continual assaults on the door were a diversion. She had two of her goons patrolling the other rooms, searching for the Organization gangsters grouping together on the other side of the suite's walls and especially the ceiling. So far they hadn't tried to break through, but it

would be only a matter of time. Nobody was stupid enough to keep on trying the same route in when they were so thoroughly blocked. There was also the ammunition question. She was going to run out eventually.

One thing she'd made quite sure of was keeping in contact with her deputies. Hudson Proctor could use his affinity to talk to the remaining Valisk survivors positioned through the asteroid, who in turn kept in touch with their recruits through the net. Communications remained the key to any revolution.

Unfortunately, it didn't guarantee success.

"Just how many people have declared for us?" Kiera asked.

Hudson Proctor took the figures he knew of, and added quite a few. No way was he about to deliver that much bad news by himself. "About a thousand in the asteroid."

"What about the fleet?" she demanded. "How many ships?"

"Jull reported several dozen were heading for low orbit before Emmet's crew wiped him out. But they wrecked the SD centre. Capone can't use the platforms to intimidate anybody, in space or on the planet."

"Where the hell is Luigi?"

"I don't know, he hasn't checked in."

"Damn it, didn't anyone listen to me? Luigi's part was crucial, the fleet must follow us down to the planet. Capone is going to get us all slung back into the beyond."

Hudson had heard the speech countless times already. He said nothing.

"I should have gone for the control centre, not Capone," Kiera said. She looked at the crystalline bulwark, which undulated rapidly, twinkling with emerald light. One of her goons fired his machine gun through a gap where the doors used to be. "Maybe we should try and get up to the defence section, there's bound to be an auxiliary control room."

“We’ll never get past Pileggi,” Hudson said. “There’s too many of them.”

“Only if we make a break for it through the front.” Kiera tilted her head up to stare at the ceiling. “I’ll bet we can . . .” She trailed off as a silver-white starship with glowing engine nacelles rose ponderously into view outside the big window wall.

“Oh shit,” Hudson murmured. “That’s the *Varrad*. And Pran Soo is not your biggest fan.”

“Talk to her, find out what she wants.”

He licked his lips and began a frown which never really had time to form. “I can’t—oh.”

The hellhawk’s fantasy image burst. It dropped out of sight, rolling as it went. Another one glided up to replace it, a dark bird-shape with red-flecked reptile scales. Hudson grinned in relief. “Etchells.”

“Ask him if he can hit Pileggi with his lasers.”

“Right.” Hudson concentrated. “Uh, he says he has a question for you.”

Kiera’s processor block bleeped. Not taking her eyes off Hudson, she slipped it out of her jacket pocket. “Yes?”

“I need to know something,” Etchells said. “Do you believe the Navy mission to the Orion Nebula is a danger to us?”

“Of course I do, that’s why you and the others have been refitted with auxiliary fusion generators. It has to be investigated.”

“We agree on that, then.”

“Good. Now target the Organization grunts holding me in here, and I’ll eliminate Capone. With him out of the way I can assign antimatter warships to the flight. The threat can be dealt with properly.”

“Twenty-seven voidhawks have swallowed away from their patrol orbits without clearance. That means they have

found an alternative source of nutrient fluid. Even if you gain control of the Organization, you will lose them.”

“But gain control of the antimatter.”

“The Confederation Navy is coming. Every orbital facility the planet has will be obliterated in their attack. Your strategy was to take New California out of the universe to a place of safety.”

“Yes?” she asked irritably. “So?”

“How do you propose to maintain the blackmail threat over the crews of the ships you dispatch to the nebula?”

Kiera turned from Hudson Proctor to look directly at the hellhawk on the other side of the window. “We’ll come up with something.”

“Your rebellion has failed. Capone is on his way with enough gangsters to overwhelm you.”

“Fuck you.”

“I sincerely believe the Navy mission is a threat to my continued existence in this form. That must be prevented. I intend to fly to Mastrit-PJ, and I’m offering you the chance to escape with me.”

“Why?”

“You have the arming codes for the combat wasps I have been loaded with. Admittedly they are only fusion warheads, but I will take you off the asteroid if you make those codes available to me.”

Kiera scanned round the ruined lounge. The machine guns opened fire again with a thunderclap tattoo. Sapphire light flexed hungrily within the crystals, causing them to expand further into the lounge. “Very well.”

The hellhawk surged forwards, its neck flattening out. Energistic power cloaked its hooked beak with a lambent red glow. The lounge’s window rippled as the tip pressed against it, then parted like water to allow the vast creature’s head into the lounge. A huge iris swivelled round to

fix on Kiera. The beak parted to reveal an airlock hatch inside.

“Welcome aboard,” Etchells said.

Al ran down the last flight of stairs to find Mickey standing at the bottom. The lieutenant took a terrified step backwards.

“Al, please, I did everything I could. I swear it.” He crossed himself elaborately. “On my mother’s life, we tried to get Jez out of there. Three of the guys got whacked just stepping through the door. Those bullets are too much. They kill you, Al, kill you dead.”

“Shut the fuck up, Mickey.”

“Sure, Al, sure thing. Absolutely. I’m dumb. From now on. Definitely.”

Al peered across the hallway. Bullets had shredded the composite wall panelling, even hacking their way into the metal behind. Opposite him, the Nixon suite’s doors glinted prismatically in the light emerging from the two surviving ceiling panels.

“Where’s Kiera, Mickey?”

“She was in there, Al. I swear.”

“Was?”

“They stopped firing a couple of minutes ago. We can sense some of them still.”

Al tapped his baseball bat on the floor, contemplating the Nixon suite. “Hey,” he shouted. “You in there. I brought a whole truckload of my guys with me, and any minute now we’re gonna march right in and beat seven types of crap out of you. Your shooters ain’t gonna be no good against this many of us. But if you come out right now, then you got my word that you don’t get your balls screwed into the nearest light socket. This is between me and Kiera now. Walk away.”

The baseball bat tapped out a metronome beat on the

ground. A figure moved behind the crystalline sheet with slow caution.

“Mickey?” Al asked. “Why didn’t you just jump the bastards through the ceiling?”

Mickey’s shoulders wriggled awkwardly under his double-breasted suit. “The ceiling?”

“Never mind.”

“I’m coming out,” Hudson Proctor called. He stepped through the gap in the crystal; his arm was outstretched, holding the machine gun by its strap.

Thirty Thompson sub-machine guns were lined up on him, most of them silver-plated. He closed his eyes and waited for the shots, Adam’s apple bobbing quickly.

Al couldn’t quite figure the spark of outrage glimmering in the man’s mind. Fear, yes, plenty of it. But Hudson Proctor was indignant about something.

“Where is she?” Al asked.

Hudson tilted over from his waist, allowing the machine gun to rest on the floor before letting go of the strap. “Gone,” he said. “A hellhawk took her off.” He paused, real anger heating his expression. “Just her. I was climbing in behind her and she shoved a fucking gun in my face. That bitch; there was room for all of us on board—she just left us behind. Didn’t give a fuck about us. I made everything happen for her, you know. Without me she would never have kept control of the hellhawks. I was the one who kept them in line.”

“Why did a hellhawk take her off?” Al asked. “She ain’t got nothing over them any more.”

“It’s Etchells, the *Stryla*, he’s obsessed about what kind of weapon the Tyrathca have on the other side of the Orion Nebula. He took her with him so she could fire the combat wasps. They’ll probably start the first inter-species war. Both of them are crazy enough.”

“Women, huh?” Al gave him a friendly grin.

Hudson's face twitched. "Yeah. Women. Fuck 'em."

"All they're good for." Al laughed.

"Yeah, right."

The baseball bat caught Hudson square on the crown of his head, smashing through the bone to cleave the brain in two. Blood splashed down the front of Al's sharply cut suit, splattering on his patent leather shoes. "And just look at the shit they get you into," he told the collapsing corpse.

Thirty streamers of white fire stabbed out in unison, vaporizing the crystal wall and decimating the possessed cowering behind it.

Libby's cries brought them to the bedroom. Everyone hung back as Al went through the door into the darkened room. Libby was kneeling on the floor, cradling a figure in a stained towelling robe. Her thin voice was a constant piteous wail, like some animal braying for its dead mate. She rocked softly backwards and forwards, dabbing at Jezzibella's face. Al moved forwards, fearing the worst. But Jezzibella's thoughts were still present, still flowing through her own brain.

Libby turned her head to face him, tears glinting down her cheeks. "Look what they did," she whimpered. "Look at my poppet, my beautiful beautiful poppet. Devils, devils all of you. That's why you were sent to the beyond. You're devils." Her shoulders trembled as she slowly curled herself around Jezzibella, cuddling her fiercely.

"It's okay," Al said. His mouth was dry and he bent down beside the stricken old woman. In his whole life he'd never been so scared for what he would see.

"Al?" Jezzibella gasped. "Al, is that you?"

Scorched, empty eye sockets searched round for him. He gripped her hand, feeling the black skin crack open under his fingers. "Sure, baby, I'm here," his faint voice faded as his throat closed up. He wanted to join Libby and put his head back and scream.

“I didn’t tell her,” Jezzibella said. “She wanted to know where you were, but I never said.”

Al was sobbing. Like it *mattered* if Kiera had found out, everyone who counted had stayed loyal in the end. But Jez hadn’t known that. Had done what she thought was needed. For him.

“You’re an angel,” he bawled. “A goddamn fucking angel sent down from heaven to show me what a worthless piece of shit I am.”

“No,” she cooed. “No, Al.”

He traced his fingers over the remnants of her precious face. “I’ll make you better,” he promised. “You’ll see. Every doctor on this crappy little world is gonna come up here and cure you. I’m gonna make them. And you’ll get well again. I’ll be here right beside you the whole time. And I’m gonna take care of you from now on. Good care. You’ll see. No more of this hurting and fighting. Never again. You’re all that matters to me. You’re everything, Jez. Everything.”

Mickey hung around at the back of the crowd shuffling about in the Nixon suite when the two terrified-looking non-possessed doctors arrived. He reckoned that was the smart thing. Be there, show off your loyalty like a medal, but don’t get into direct line of sight. Not at a time like this. He knew the boss well enough by now. Somebody was going to pay very hard for what was going down. Very hard indeed. The asteroid was rotten with rumours about how the Confederation had learned how to torture a possessed for months. If anybody could improve on that, it would be the Organization, with Patricia as chief researcher.

A hand clamped down on his shoulder. Mickey’s nerves were so shot they fired his leg muscles to jump. The hand prevented any actual movement, holding him fast with abnormal strength. “What is this?” he squawked with fake indignation. “Don’t you know who I am?”

"I don't care who you are," Gerald Skibbow said. "Tell me where Kiera is."

Mickey tried to size up his . . . well, not assailant, exactly—questioner. Unnervingly powerful, and zero sense of humour. Not a good combination. "The bitch showed us a clean pair of heels. A hellhawk took her off. Now let me have my shoulder back, man. Jesus!"

"Where did it take her?"

"Where did . . . Oh, like you're going after them?" Mickey sneered.

"Yes."

Mickey didn't like the way this was speedballing downhill. He dropped the sarcasm approach. "The Orion Nebula, okay. Can I go now, thank you."

"Why would she go there?"

"What is it to you, pal?" a voice asked.

Gerald let go of Mickey and turned to face Al Capone. "Kiera is possessing our daughter. We want her back."

Al nodded thoughtfully. "You and I need to talk."

Rocio watched the taxi roll across the docking ledge towards him. Its elephant trunk airlock tube lifted up and fastened onto his hatch.

"We've got a visitor," he announced to Beth and Jed.

Both of them hurried along the main corridor to the airlock. The hatch was already open, framing a familiar figure. "Bugger me," she grunted. "Gerald!"

He smiled wearily at her. "Hello. I brought some decent grub. Figured I owe you that much." There was a huge pile of boxes on the floor of the taxi behind him.

"What happened, mate?" Jed asked. He was peering round the old loon, trying to read the labels.

"I rescued my husband." Loren manifested her own face over Gerald's, and smiled at the two youngsters. "I must

thank you for taking care of him. God knows it's not easy at the best of times."

"Rocio!" Beth yelled.

A shocked Jed was stumbling backwards. "He's possessed! Run!"

Rocio's face appeared in one of the brass-rimmed portholes. "It's all right," he assured them. "I cut a deal with Al Capone. We're taking the Skibbows with us, and tracking down my murderous old friend Etchells. In return, the Organization supplies the hellhawks with every technical assistance they need securing Almaden, and then leaves them alone."

Beth gave Gerald a nervous glance, not at all trustful, no matter who was possessing him. "Where are we going?" she asked Rocio.

"The Orion Nebula. To start with."

23

The STNI-986M was a basic VTOL utility jet (unimaginatively nicknamed Stony); subsonic, with a blunt-tube fuselage which could carry either twenty tonnes of cargo or a hundred passengers. Seven New Washington Navy (NWN) Transport Command squadrons of the durable little vehicles had been flown to Ombey when the President answered their ally's call for military assistance to liberate Mortonridge. Ever since General Hiltch authorized aircraft to fly over secured areas of Mortonridge, they'd become a familiar sight to the occupation troops. After Ketton, they'd been invaluable in supporting the new frontline advance policy which had spread the serjeants dangerously thin over the ground as they divided the peninsula into confinement zones. Outbound from Fort Forward they would deliver food, equipment, and ammunition to the upcountry stations; on the return they invariably evacuated the most serious body-abuse cases of ex-possessed for medical treatment.

Even on airframes intended for rugged duty, full-time usage was producing maintenance problems. Spare parts were also scarce; Ombey's indigenous industries were already struggling to keep frontline equipment and the Royal Marine

engineering brigades going. All the Stony squadrons had experienced mid-flight emergency landings and unexplained powerdowns. The rover reporters covering the Liberation knew all about the STI-986M's recent shortcomings, though it was never mentioned in their official reports. Not good for civilian morale. There was no outright censorship, but they all knew they were part of the Liberation campaign, helping to convince people that the possessed could be beaten. Standard wartime compromise, reporting what was in the army's interest in order to get the maximum amount of information.

So Tim Beard cut back on his physiological input when the Stony carrying him and Hugh Rosler lifted from Fort Forward at dawn. He wanted to give the accessors back home a small feeling of excitement as the plane swept low across the endless steppes of dried mud, which meant toning down his body's instinctive unease. It helped that he was sitting so close to Hugh, the pair of them wedged in a gap between a couple of composite drums full of nutrient soup for the serjeants. Hugh always seemed perfectly at ease; even when Ketton ripped itself free of the planet he'd stood up squarely, regarding the spectacle with a kind of amused awe while the rest of the rovers were crouched down on the quaking ground, heads buried between their legs. He also had a neat eye for trouble. There were a couple of occasions when the rover corps had been clambering over ruins when he'd spotted booby traps missed by the serjeants and Marine engineers. Not the greatest conversationalist, but Tim felt safe around him.

It was one of the reasons he'd asked Hugh to come along. This wasn't a flight organized for them by the army, but the story was too good to wait for the liaison officer to get round to it. And good stories about the Liberation were becoming hard to find. But Tim had been covering military stories for twenty years now: he knew how to find his way round the archaic chain of command, which people to cultivate. Pilots were good material, and useful, almost as much as serjeants.

Finding a ride on the early flight among the crates and pods was easy enough.

The Stony curved away from Fort Forward and headed south, following the remnants of the M6. Once they'd settled into their two hundred metre operational altitude, Tim eased the buckle back on what was laughingly called his safety strap, and crouched down by the door port. Enhanced retinas zoomed in on the road below. He'd dispatched a hundred fleks back to the studio with the same view; by now the start of the M6 around the old firebreak was as familiar to the average Confederation citizen as the road outside their own home. But with each trip he progressed a little further along the road, deeper into the final enclaves of the possessed. In the first couple of weeks, it was astounding progress indeed. None of the rovers had to manufacture the optimistic buzz that pervaded their recordings. It was different today, there was progress, still, but it was difficult to capture the essence just by panning a shot from horizon to horizon.

The tactical maps urged on them by the army liaison officers had changed considerably from the original swathe of incriminating pink stretching across Mortonridge which delineated the possessed territory. At first the borders had contracted noose-style, then geographical contours showed up along the rim of pinkness, interfering with the rate of advance. After Ketton it had changed again. The serjeants had been deployed in spearhead thrusts, carving corridors through the possessed territories. Separation and isolation, General Hiltch's plan to prevent the possessed from collecting in the kind of density which would kick off another Ketton incident. The current tactical map showed Mortonridge covered in slowly shrinking pink blotches separating from each other like evaporating puddles. Of course, no one actually knew what that critical number was which had to be avoided at all costs. So the serjeants toiled on relentlessly, guided by numerical simulations based on someone's best

guess. And there were no more harpoon deluges to make the job easier, nor even SD laser fire to soften up a strongly defended position. The front line was back to clearing the land in the hardest way possible.

Tim's retinas tracked keenly along the carbon-concrete ribbon which the Stony was following. Royal Marine mecha-noids had bulldozed entire swamps of saturated soil from the road as the army swept down the spine of the peninsula. At times the single cleared carriageway was twenty metres below the tops of the new banks, as if it was some kind of cooled lava river confined to steep heat-erosion valleys. The sidewalls were solidified by chemical cement, bonding the slush together in artificial molecular clusters that traded their initial strength with a limited lifespan. Sunlight shimmered off them in vast sapphire and emerald defraction patterns as the Stony whisked by overhead. All the original bridges had been swept away, leaving destitute towers protruding from the mud at precarious angles. Of their replacements, no two were the same. Small gullies had simple scaffolding archways of monobonded silicon curving over their sluggish streams. Beautiful single-span suspension bridges leapt across gaps half a kilometre wide, their gossamer cables glinting like thin icicles in the clear dawn air. Programmable silicon pontoons carried the mesh-carpet road across broad valley floors in heroic relay.

"The financial cost of this recaptured motorway is roughly ten million Kulu pounds per kilometre," Tim said. "Thirty times the price of the original, and it hasn't even got electronic traffic control. It will probably be the Liberation's most enduring physical memorial, even though thirty-eight per cent of it is classed as a temporary structure. Ground troops know it as the road to the other side of hell."

"You could always take the optimistic view," Hugh Rosler said.

Tim put the narrative track memory on pause. "If I could

find one, I would. It's not as if I'm rooting for the possessed. Being positive after all this time is flat-out impossible. We have to tell the truth occasionally."

Hugh nodded through the rectangular port. "Gimmie convoy, look."

A long snake of trucks and buses was winding its way north along the reclaimed road. The buses meant it would be mostly civilians, ex-possessed being carried away to safety. "Gimmies" was the term which the rovers had privately evolved for them. Every interview when they came staggering out of the zero-tau pods was the same litany of demands: give me medical treatment, give me clothes, give me food, give me the rest of my family, give me somewhere safe to live, give me my life back. And why did it take you so long to save me?

They'd actually stopped recording interviews with the newly reprieved. Ombey's population was becoming increasingly antagonised by their fellow citizens' lack of gratitude.

Two hundred and fifty kilometres south of the old firebreak line, a big staging area had been laid out at the side of the M6, as if a batch of liquid carbon-concrete had squirted out from the edge of the motorway to stain the mud before solidifying. A single small road broke away from it to head out across the open country. There could have been an original feed road down below the hardening mires, but the Royal Marine engineering brigade had chosen to ignore it in favour of running their own route directly over newly surveyed ground, sticking to the most stable regions. Similar staging areas were strung along the whole length of the M6, flinging off side roads which mimicked the original branch roads. They were the supply lines for the army as it overran the towns; not so much for the benefit of the frontline serjeants, but the support teams and occupation forces which came in their wake.

This staging area was empty, though covered in mud-tracks showing just how many vehicles had been assembled

here at one time. The Stony banked sharply above it, and swept away to chase along the supply road. A couple of minutes later they were circling the remnants of Exnall.

The occupation station's landing field was a broad sheet of micro-mesh composite spread out across a flat patch of land on the (official) edge of town, with chemical concrete injected into the soil underneath. Mud still percolated through in patches where the chemicals hadn't reached.

None of the cargo crew were surprised when Tim and Hugh jumped down out of the Stony's open hatch. They just grinned as the two rovers strained to lift their feet from the sticky mud.

Tim opened a new memory cell file for his report, and quickly reduced his olfactory sensitivity. Most of the dead plant and animal life had been swallowed by the mud, but the peninsula's constant natural showers kept uncovering them. Fortunately, the smell wasn't anything like as bad as it had been to start with.

They hitched a lift on the back of a jeep into the occupation station which had been set up in the square at the end of Maingreen.

"Where was the DataAxis office?" Tim asked.

Hugh stared around, trying to make sense of the alien territory. "Not sure; I'd have to check with a guidance block. This is as bad as Pompeii the morning after."

Tim kept recording as they splashed along the deep ruts in the mire, preserving Hugh's comments about the few landmarks of his old town which he could recognize. The deluge had hit arboreal Exnall hard. Mud had toppled the big harandrid trees onto the buildings they'd once overhung so gracefully; crumpling the shops and houses even before the foundations were undermined. Sloping roofs constructed out of carbon hyperfilament beams had sheered off to twirl away across the currents of mud, momentum snapping them through the surviving pickets of tree stumps. A whole clus-

ter of them had come to rest at the end of Maingreen, making it look as though half of the town's buildings had been buried together up to their rafters. Facades had drifted about freely like architectural rafts until the gradually hardening mud began to anchor them fast. Where they lay across the roads, jeeps and trucks had driven straight over them, crunching parallel tyre tracks of bricks and planking deeper into the dehydrating march. Only the foundations and stubby, splintered remnants of ground-floor walls indicated the town's outline, along with slumbering humps of mud-smothered harandrid.

Programmable silicon halls and igloos had been set up in the central civic district to serve as the occupation station; neither the town hall nor the police station remained intact. Army traffic sped along the narrow lanes through the new structures, while squads of serjeants and occupation troops marched between them. Tim and Hugh left the jeep to look around.

Hugh eyed the various slopes rumpling the landscape and consulted his guidance block. "This is about where it happened," he said. "The crowd gathered here after Finnuala's blanket datavise."

Tim panned round the gloomy panorama. "What price victory?" he said softly. "This isn't even the eye of the storm." He zoomed in on several stagnant pools, examining the bent grass and weeds struggling at the edge. If vegetation was to return to this peninsula, it would spread out from fresh water, he reasoned. But these filthy, sodden blades served only to play host for a variety of brown fungal blooms which thrived in the humidity. He doubted they would last much longer.

They wandered through the occupation station, capturing random images of the army reorganising itself. Serjeant casualties lying in rows of cots in a field hospital. Engineers and mechanoids working on all types of equipment. The un-

ending flow of trucks that trundled past, their hub engines humming angrily as they fought for traction in the mud.

“Hey, you two!” Elana Duncan shouted from across the road. “What the hell are you doing?”

They crossed over to her, dodging a pair of jeeps. “We’re rovers,” Tim told her. “Just looking round.”

Claws closed around his upper arm, preventing him from moving. He was pretty sure that if she wanted to, she could have snipped clean through the bone. She touched a sensor block to his chest. Not gently, either.

“Okay, now you.” Hugh submitted to the procedure without complaint.

“There aren’t any rover reporters scheduled to come out here today,” Elana said. “The colonel hasn’t cleared Exnall yet.”

“I know,” Tim said. “I just wanted to get ahead of the pack.”

“Typical,” Elana grunted. She retreated back into the hall where twenty bulky zero-tau pods had been set up. All of them had active infinite-black surfaces.

Tim followed her. “This your department?”

“You got it, sonny. I get to perform the final act of liberation on these great people we’re here to rescue. That’s why I wanted to know who you were. You’re not army, and you’re too healthy to be ex-possessed. I got to recognize that, it’s like second nature now.”

“Glad someone’s alert.”

“Knock it off.” Her head rocked up and down as she examined them. “If you want to ask questions, ask. I’m bored enough that I’ll probably answer. You’re here because this is Exnall, right?”

Tim grinned. “Well, this is where it all started. That gives me a legitimate interest. Showing the accessors that it’s been retaken and sanitised makes for a good piece.”

“Typical rover, put the story before anything else, like

mundane security and common-sense safety. I should have just shot you.”

“But you didn’t. That means you’ve got confidence in the serjeants?”

“Could be. I know I couldn’t do what they’re doing. *Still* doing. Thought I could when I came here, but this whole Liberation is one big learning curve, for all of us, right? We just don’t do war like this any more, if we ever did. Even if a conflict goes on for a couple of years, individual battles are supposed to be brutal and fast. Soldiers take a break from the front, have some R & R, grab some stims and some ass before they go back. One side makes a few gains, the other knocks them back. That’s the way it goes, but this—it never stops, not for one second. Have you ever captured that in your sensevises? The real essence of what this is about? One serjeant loses concentration for one second, and one of those bastards will slip through. It’ll start up all over again on another continent. One mistake. *One*. This isn’t a human war. The weapon which is going to win this is perfection. The possessed? They have to commit to being a hundred per cent treacherous devious sons of bitches, never let up trying to sneak one of their kind past us. Our serjeants, now they have to be eternally vigilant, never ever walk along the wrong side of the road because the mud isn’t so deep and vile there. You’ve got no idea what that takes.”

“Determination,” Tim ventured.

“Not even close. That’s an emotion. That’s a way in to your heart, weakening you. That can’t be allowed here. Human motivations have to be abandoned. Machines are what we need.”

“I thought that’s what the serjeants are.”

“Oh yeah, they’re good. Not bad at all for a first generation weapon. But the Edenists have got to improve on them, build some real mean mothers for the next Liberation. Something like us boosted, and with even less personality

than the serjeants. I've got to know a few of them, and they're still too human for this."

"You think there's going to be another Liberation?"

"Sure. Nobody's come up with another method of kicking the bastards out of the bodies they've stolen. Until that happens, we've got to keep them on the run. I told you: show no weakness. Pick another planet, maybe one of those Capone infiltrated, and start rescuing it before they take it away. Let them know we'll never let up chasing their asses out of our universe."

"Would you join that next Liberation?"

"Not a chance. I've done my bit, and learned my lesson. This is too long. You wanted a story about what Exnall was like, you came a day too late. We still had some of the possessed around yesterday, waiting for zero-tau. They're the ones you should have talked to."

"What did they tell you?"

"That they hate the Liberation the same way we do. It's wearing them down, they haven't got enough food, the rain doesn't stop, the mud climbs into bed with them each night. And ever since Ketton took that Ekelund bitch away, their organized resistance folded in. Now it's just gone back to instinct, that's why they fight. They're losing it, because they're human. They came back here because they were determined to end their suffering, right? That's the ultimate human motivator. Anything to escape the beyond. But now they're here, where they thought they wanted to be, they've got all their old flaws back. As soon as they became human again, it becomes possible to beat them."

"Until they take their whole planet out of the universe," Tim protested.

"Fine by me. That removes them from interfering with us any more. A stalemate in this war means we have won. Our purpose is to prevent them from spreading."

“But even the war isn’t an end to this,” Hugh said. “Have you forgotten you have a soul? That you will die one day?”

Elana’s claws clacked irritably. “No, I haven’t forgotten. But right now I have a job to do. That’s what matters, that’s what’s important. When I die, I’ll confront the beyond fair and square. All this philosophising and moralising and agonising we’re doing, it’s all bullshit. When it comes down to it, you’re on your own.”

“Just like life,” Hugh said with a gentle smile.

Tim frowned at him. It was most unlike Hugh to offer any comment on death and the beyond; the one subject he (strangely) always avoided.

“You got it,” Elana boomed approvingly.

Tim said goodbye, and left her monitoring the zero-tau pods. “Live death like you live life, huh?” he chided Hugh when they were far enough away to be outside the range of the mercenary’s enhanced auditory senses.

“Something like that,” Hugh responded solemnly.

“Interesting person, our Elana,” Tim said. “The interview will need some tight editing, though. She’ll depress the hell out of anyone who hears her ranting on like that.”

“Perhaps you should let her speak. She’s been exposed to the possessed for a long time. Whether she admits it or not, that’s influenced her thinking. Don’t slant that.”

“I do not slant my reports.”

“I’ve accessed your pieces, you dumb everything down for your audience. They’re just a compilation of highlights.”

“Keeps them accessed, doesn’t it? Have you seen our ratings?”

“There’s more to news than marketing points. You have to include substance occasionally. It balances and emphasises those highlights you worship.”

“Shit, how did you ever wind up in this business?”

“I was made for it,” Hugh said, which he apparently found hilarious.

Tim gave him a bewildered glance. Then his neural nanonics reported his communications block was receiving a priority call from the Fort Forward studio chief. It was the news that the Confederation Navy had attacked Arnstat.

“Holy shit,” Tim muttered. All around him, marines and mercenaries were cheering and calling out to each other. Trucks and jeeps sounded their horns in continual blasts.

“That’s not good,” Hugh said. “They knew what the effect would be.”

“Damn it, yes,” Tim said. “We’ve lost the story.”

“An entire planet snatched away to another realm, and all that concerns you is the story?”

“Don’t you see?” Tim swept his arms round extravagantly, encompassing the occupation station in one gesture. “This was *the* story, the only one: we were on the front line against the possessed. What we saw and said mattered. Now it doesn’t. Just like that.” His neural nanonics astronomy program found him the section of dark azure sky where Avon’s star shone unseen. He glared at it in frustration. “Someone up there is changing Confederation policy, and I’m stuck down here. I can’t find out why.”

Cochrane saw it first. Naturally, he called it Tinkerbell.

Not quite limber enough to stay in a full lotus position for hours on end, the hippie was sprawled bonelessly on a leather beanbag, facing the direction Ketton island was flying in. With a Jack Daniels in one hand and his purple sunglasses in place he possibly wasn’t as alert as he should have been. But then, none of the other ten people sharing the top of the headland with him saw it.

They were, as McPhee complained later, looking out for something massive, a planet or a moon, or perhaps even Valisk. An object that would appear as a small dark patch amid the vanishing-point glare and slowly swell in size as the island drew closer.

The last thing anyone expected was a pebble-sized crystal with a splinter of sunlight entombed at its centre arrowing in out of the bright void ahead. But that's what they got.

"Holy mamma, hey you cats, look at this," Cochrane whooped. He tried to point, sending Jack Daniels sloshing across his flares.

The crystal was sliding over the cliff edge, its multifaceted surface stabbing out thin beams of pure white light in every direction. It swooped in towards Cochrane and his fellow watchers, keeping a level four metres off the ground. By then Cochrane was on his feet dancing and waving at it. "Over here, man. We're here. Here boy, come on, come to your big old buddy."

The crystal curved tightly, circling over their heads to their gasps and excited shouts.

"Yes!" Cochrane yelled. "It knows we're here. It's alive, gotta be, man; look at the way it's buzzing about, like some kind of inter-cosmic fairy." Slivers of light from the crystal flashed across his sunglasses. "Yoww, that's bright. Hey, Tinkerbell, tone it down, baby."

Delvan stared at their visitor in absolute awe, a hand held in front of his face to shield him from the dazzling light. "Is it an angel?"

"Naw," Cochrane chortled. "Too small. Angels are huge great mothers with flaming swords. Tinkerbell, that's who we've got here." He cupped his hands round his mouth. "Yo, Tinks, how's it hanging?"

Choma's dark, weighty hand tapped Cochrane's shoulder. The hippie flinched.

"I don't wish to be churlish," the serjeant said. "But I believe there are more appropriate methods with which to open communications with an unknown xenoc species."

"Oh yeah?" Cochrane sneered. "Then how come you're already boring her away?"

The crystal changed direction, speeding away to fly over

the main headland camp. Cochrane started running after it, yelling and waving.

Sinon, like every other serjeant on the island, had turned to look at the strange pursuit as soon as Choma informed them of the crystal's arrival. "We have an encounter situation," he announced to the humans around him.

Stephanie stared at the brilliant grain of crystal leading Cochrane on a merry chase and let out a small groan of dismay. They really shouldn't have let the old hippie join the forward watching group.

"What's happening?" Moyo asked.

"Some kind of flying xenoc," she explained.

"Or probe," Sinon said. "We are attempting to communicate with affinity."

The serjeants combined their mental voice into a collective hail. As well as clear ringing words of greeting, mathematical symbols, and pictographics, they produced a spectrum of pure emotional tones. None of it provoked any kind of discernible answer.

The crystal slowed again, drifting over the headland group. There were over sixty humans camping out together now; Stephanie's initial group had been joined by a steady stream of deserters from Ekelund's army. They'd broken away over the past week, sometimes in groups, sometimes individually; all of them rejecting her authority and growing intolerance. The word they brought from the old town wasn't good. Martial law was strictly enforced, turning the whole place into a virtual prison. At the moment, her efforts were focused on recovering as many rifles as possible from the ruins and mounds of loose soil. Apparently she still hadn't abandoned her plan to rid the island of serjeants and disloyal possessed.

Stephanie stood looking up at the twinkling crystal as it traced a meandering course overhead. Cochrane was still lumbering along thirty metres behind. His annoyed cries carried faintly through the air. "Any reply yet?" she asked.

“None,” the serjeant told them.

People had risen to their feet, gawping at the tiny point of light. It seemed oblivious to all of them. Stephanie concentrated on the folds of iridescent shadow which her mind’s senses were revealing. Human and serjeant minds glowed within it, easily recognizable; the crystal existed as a sharply defined teardrop-filigree of sapphire. It was almost like a computer graphic, a total contrast to everything else she could perceive this way. As it grew closer its composition jumped up to perfect clarity; in a dimension-defying twist the inner threads of sapphire were longer than its diameter.

She’d stopped being amazed by wonders since Ketton left Mortonridge. Now she was simply curious.

“That can’t be natural,” she insisted.

Sinon spoke for the mini-consensus of serjeants. “We concur. Its behaviour and structure is indicative of a high-order entity.”

“I can’t make out any kind of thoughts.”

“Not like ours. That is inevitable. It seems well adjusted to this realm. Commonality would therefore be unlikely.”

“You think it’s a native?”

“If not an actual aboriginal, then something equivalent to their AI. It does seem to be self-determining, a good indicator of independence.”

“Or good programming,” Moyo said. “Our reconnaissance drones would have this much awareness.”

“Another possibility,” Sinon agreed.

“None of that matters,” Stephanie said. “It proves there’s some kind of sentience here. We have to make contact and ask for help.”

“That’s if they understand the concept,” Franklin said.

This speculation is irrelevant, Choma said. What it is does not matter, what it is capable of does. Communication has to be established.

It will not respond to any of our attempts, Sinon said.

If it does not sense affinity or atmospheric compression then we have little chance of initiating contact.

Mimic it, Choma said. The mini-consensus queried him.

It can obviously sense us, he explained. **Therefore we must demonstrate we are equally aware of it. Once it knows this, it will logically begin seeking communication channels. The surest demonstration possible is to use our energistic power to assemble a simulacrum.**

They focused their minds on a stone lying at Sinon's feet, fourteen thousand serjeants conceiving it as a small clear diamond with a flame of cold light burning bright at its centre. It rose into the air, shedding crumbs of mud as it went.

The original crystal swerved round and approached the illusion, orbiting it slowly. In response, the serjeants moved their crystal in a similar motion, the two of them describing an elaborate spiral over Sinon's head.

That attracted its attention, Choma said confidently.

Cochrane arrived, panting heavily. "Hey, Tinks, slow down, babe." He rested his hands on his upper thighs, glancing up with a crooked expression. "What's going on here, man? Is she breeding?"

"We are attempting to open communications," Sinon said.

"Yeah?" Cochrane reached up, his hand open. "Easy, dude."

"Don't—" Sinon and Stephanie said it simultaneously.

Cochrane's hand closed round Tinkerbelle. And kept closing. His fingers and palm elongated as though the air had become a distorting mirror. They were drawn down into the crystal. He squawked in panicked astonishment as his wrist stretched out fluidly and began to follow his hand into the interior. "Ho shiiiiit—" His body was abruptly tugged along, feet leaving the ground.

Stephanie exerted her energistic power, trying to pull him back. *Insisting* he return. She felt the serjeants adding their ability to hers. None of them could attach their desperate

thoughts to the wailing hippie. His body's physical mass had become elusive, it was like trying to grip on a rope of water.

The frantic yelling cut off as his head was sucked within the crystal's boundary. The torso and legs followed quickly.

"Cochrane!" Franklin yelled.

A pair of gold-rimmed sunglasses with purple lenses fell to the ground.

Stephanie couldn't even sense the hippie's thoughts any more. She waited numbly to see who would be devoured next. It was only a couple of metres from her.

The crystal sparkled with red and gold light for a moment, then reverted to pure white. It shot off at high velocity across the rumpled mudlands towards the town.

"It killed him," she grunted in horror.

"Ate him," Rana said.

Alternatively, it took a sample, Sinon said to his fellow serjeants. The shocked humans probably wouldn't want to hear quite such a clinical analysis.

It didn't select Cochrane, Choma said. **He selected it. Or more likely, it was a simple defence mechanism.**

I hope not. That would imply we have come to a hostile environment. I would prefer to consider it a sampling process.

The method of capture was extraordinary, Choma said. **Is it some kind of crystalline neutronium, perhaps? Nothing else could suck him in like that.**

We don't even know if gravity or solid matter exist in this realm, Sinon said. **Besides, there was no energy emission. If his mass was being compressed by gravity, we would all have been obliterated by the radiation burst.**

Then let us hope it was a sampling method.

Yes. Sinon conveyed a slight uncertainty with his thought. **Shame it was Cochrane.**

It could have been Ekelund.

Sinon watched the crystal slicing freely across the land. It had become a cometary streak. **That may yet happen.**

Annette Ekelund had established her new headquarters on top of the steep mound which used to be Ketton's town hall. Rectangular sections of various buildings had been salvaged from the ruins all around and propped up against each other; energistic power modified them into heavy canvas tents printed with green and black jungle camouflage. Three of them contained the last remaining stocks of food. One served as an armoury and makeshift engineering shop where Milne and his team worked repairing the rifles which had been dug from the wet soil. The last, sitting right on the brow, was Annette's personal quarters and command post. She had the netting rolled up at both ends, giving her a good view out across the island's blotchy grey-brown land right to the scabrous edges. Maps and clipboards were strewn cross the trestle table in the centre. Coloured pencils had marked out the army's defensive fortifications around Ketton, along with possible lines of attack based on scout reports of the terrain outside. Serjeant positions and estimated strengths were all indicated.

The information had taken days to compile. Right now Annette was paying it no heed; she was glaring at the captain who stood to attention in front of her. Soi Hon lounged back in his canvas chair at the side of the table, watching the scene with no attempt to hide his amusement.

"Five of the patrol refused to come back," the captain said. "They just kept on walking, said they were going to pitch in with the serjeants."

"The enemy," Annette corrected.

"Yes. The enemy. There was only three of us left after that. We couldn't force them back."

"You are pathetic," Annette told him angrily. "How you were ever considered officer material I don't know. You

don't just go with your men on walks around the perimeter, you're their leader for Christ's sake. That means you know their vulnerabilities as well as their strengths. You should have seen this coming, especially now you can sense their raw emotional state. They should never have been allowed out to betray us like this. Your fault."

The captain gave her a look of incredulous dismay. "This is ridiculous. Everyone here is worried shitless. I could see that in them clear enough. There's no way of telling what they were going to do about it."

"You should have known. You're on null rations for thirty-six hours, and demoted to corporal. Now get back to your division, you're a disgrace."

"I dug up that food. I was in the shit up to my elbows for two days working for it. You can't do this. It's mine."

"It will be in thirty-six hours. Not before."

They stared at each other across the table. Sheets of paper stirred silently.

"Fine," the ex-captain snapped. He stormed out.

Annette glared after him, furious at how slack everyone was becoming. Didn't any of them understand how critical these times were?

"Well handled," Soi Hon said, his voice verging on a sneer.

"You think he should go unpunished? You wouldn't believe how fast things would unravel if I didn't enforce order."

"Your society would unravel. Not individual lives."

"You think another kind of society can survive here?"

"Let go, and see what evolves."

"That's major bullshit, even by your standards."

Soi Hon shrugged, unconcerned. "I'd love to know where you think we're actually heading if not oblivion."

"This realm offers us sanctuary."

"Will you cut my ration if I make an observation?"

“It wouldn’t make any difference. I know you. You have your own little stash somewhere, I’m sure.”

“I have learned prudence, I don’t deny. What I suggest you consider is the possibility that the serjeants might be correct. This realm might offer us sanctuary if we were on a planet. However, this island does appear to be terribly finite.”

“It is, but the realm is not. We came here *instinctively*; we knew this was the one place where we would be safe. It can be paradise, if we just believe in it. You’ve seen how our energetic power operates here. The effects take longer to form, but when they do the change is more profound.”

“Pity they can’t slowly grow us some food, or even air. I’d probably settle for a little more land.”

“If that’s what you think, why stay with me? Why not run away like all those weak fools?”

“You have the food secure, and there is no bush for me to hide in. Not even a single bush, in fact. Which pains me. This land is . . . not good. It has no spirit.”

“We can have what we want.” Annette was looking directly out of the open end of the tent at the sharp, close horizon. “We can give the land its spirit back.”

“How?”

“By finishing what we started. By escaping. They’re holding us back, you see.”

“The serjeants?”

“Yes.” She gave him a smile, content that he understood. “This is the realm where our dreams come true. But their dreams are of rationality and physics, the old order. They are machines, soulless, they cannot understand what we can become here. They hold our winged thoughts back in cages of steel. Imagine it, Soi, if we rid ourselves of their restraints. This island expanding, new land growing out from the cliff edges. Land that’s covered in rich green life. We are a seed here, we can germinate into something wonderful. Heaven is what you make it: that’s such a precious destiny, every

human's entitlement. And we can see it. Out there, waiting for us. We've come so far, they cannot be allowed to contaminate our minds with their dark yearning to remain in the past."

Soi Hon raised an eyebrow. "A seed? That's how you see this island?"

"Yes. One that can bloom into whatever kingdom we want."

"I doubt that. I really do. We are humans in stolen bodies, not embryonic godlings."

"And yet, we've already taken the first step." She lifted her hands up in a theatrical offering to the sky. "After all, we said there was to be light, didn't we?"

"I've read that book, but not many of my people did. How typically Euro-Christian, you think your origins and mythology populated the world. All you actually gave us was pollution, war, and disease."

Annette grinned wolfishly. "Come on, Soi, show a little levity. Get radical again. This place can be made to work. Once we eliminate the serjeants we'll have a chance." Her smile faded as she sensed the babble of confusion and surprise emanating from within the communal mind of the serjeants. Ever-present, it sat on the edge of her consciousness, a dawn refusing to rise. Now their cool thoughts were changing, coming as close to panic as she'd known. "What's upset them?"

She and Soi walked over to the end of the tent, and looked over at the dark mass of serjeants clustering in the foothills of Catmos Vale's lost walls.

"Well, they're not charging at us," Soi said. "That's gratifying."

"Something's wrong." She brought up her field binoculars, and searched the serjeants' encampment, trying to spot any abnormality amid the large dark bodies. They were sitting calmly together as always. Then she realized every head was turned to face her. The binoculars came down, allowing her to frown back at them. "I don't get this."

“There, look.” Soi was pointing at a bright spark rushing over the town’s perimeter fortifications. The soldiers below it were shouting and gesticulating wildly as it soared imperiously overhead.

It hurtled towards the mound at the centre of town.

“Mine,” Annette said warmly. With her feet apart, she brought her hands together in a pistol grip. A squat black maser carbine materialized, blunt barrel lining up on the approaching crystal.

“I don’t think that’s a weapon,” Soi said. He started to back away from Annette. “It didn’t come from the serjeants, they’re as puzzled as us.”

“It doesn’t have permission to enter my town.”

Soi started to run. A slim flare of intense white fire spewed out of Annette’s gun, darting towards the approaching crystal. It veered effortlessly aside, arcing over Soi. He stumbled as the spires of light pirouetted around him.

Smoothly and methodically, Annette turned to follow the invader. She pulled back on the trigger again, flinging the most potent bolt of white fire she could muster. It had no effect. The crystal whipped round in a tight parabola above Soi and accelerated back the way it came.

The serjeants watched it return. This time it never even slowed down as it tore through the air above them. Once it was over the cliff it began to curve downwards. Delvan rushed up to the very edge and flung himself flat on the crusted mud, head just peeping over. The last he saw of it was a glimmer of light descending parallel to the crinkled cliff-face before disappearing underneath the antagonistic planes of fractured rock.

The traders hooted and clanked their way along Cricklade’s drive in seven big lorries. Steam hissed energetically out of the iron stacks behind their cabs, while gleaming brass pistons spun the front wheels. They growled to a halt in front of

the manor's broad steps, dripping oil on the gravel and wheezing steam from leaky couplings.

Luca came forward to greet them. As far as he could tell, the thoughts of the people riding in the cabs were amicable enough. He wasn't expecting trouble; traders had visited Cricklade before, but never in a convoy this size. A group of ten estate workers were on close call, just in case.

The traders' leader climbed down out of the lead lorry and introduced himself as Lionel. He was a short man with flowing blond hair tied back with a leather lace, wearing worn blue denim jeans and a round-neck sweater: working clothes which were almost an extension of his forthright attitude. After a couple of minutes' conversation, sizing each other up, Luca invited him indoors.

Lionel settled appreciatively into the study's leather armchair, sipping at the Norfolk Tears Luca offered him. If he was concerned about the restrained, moody atmosphere grumbling around the manor, it never showed. "Our main commodity this trip is fish," he said. "Mostly smoked, but we have some on ice as well. Apart from that, we're carrying vegetable and fruit seeds, fertilised chicken eggs, some fancy perfumes, a few power tools. We're trying to build a reputation for reliability, so if there's something you want which we haven't got, we'll try to get hold of it for our next visit."

"What are you looking for?" Luca asked as he sat down behind the broad desk.

"Flour, meat, some new tractor bearings, a power socket to recharge the lorries." He raised his glass. "A decent drink." They grinned, and touched their glasses. Lionel's gaze lingered on Luca's hand for a moment. The contrast between their skin was subtle, but noticeable. Luca's was darker, thicker, a true guide to Grant's age; Lionel maintained an altogether more youthful sheen.

"What sort of exchange rate were you thinking of for the fish?" Luca asked.

“For flour, five to one, direct weight.”

“Don’t bugger about wasting my time.”

“I’m not. Fish is meat, valuable protein. There’s also carriage; Cricklade’s a long way inland.”

“That’s why we have sheep and cattle; we’re exporting meat. But I can pay your carriage costs in electricity, we have our own heat shaft.”

“Our power cells are seventy per cent charged.”

The haggling went on for a good forty minutes. When Suannah came in she found them on their third round of Norfolk Tears. She sat on the side of Luca’s chair, his arm around her waist. “How’s it going?” she asked.

“I hope you like fish,” Luca told her. “We’ve just bought three tons of it.”

“Oh bloody hell.” She plucked the glass of Tears from his hand, and sipped thoughtfully. “I suppose there’s room in the freezer room. I’ll have to have a word with Cook.”

“Lionel has some interesting news, as well.”

“Oh?” She gave the trader a pleasant, enquiring look.

Lionel smiled, covering a mild curiosity. Like Luca, Suannah was letting her host body’s age show. The first middle-aged people he’d seen since Norfolk came to this realm. “We got our fish from a ship in Holbeach, the *Cranborne*. They were docked there a week ago, trading their cargo for an engine repair. Should still be there.”

“Yes?” she asked.

“The *Cranborne* is a merchant multitramp,” Luca said. “She just sails between islands picking up cargo and passengers, whatever pays; she can fish, dredge, harvest mintweed, icebreak, you name it.”

“Her current crew have rigged her with nets,” Lionel said. “There’s not much charter work going at the moment, so trawling has become their livelihood. They’re also talking about trading between islands. Once things have settled

down, they'll have a better idea of who produces what and the kind of goods they can carry to exchange."

"I'm happy for them," Susannah said. "Why tell me?"

"It's a way of getting to Norwich," Luca said. "A start, anyway."

Susannah looked hard into his face, now falling back into Grant's familiar features. The relapse had been accelerating ever since he returned from his trip to Knossington with the news that the aeroambulance didn't work, its electronics simply couldn't operate in this realm. "A voyage that far would be expensive," she said quietly.

"Cricklade could afford it."

"Yes," she said carefully. "It could. But it's not ours any more. If we take that much food or Tears or horses the others will claim we stole it. We wouldn't be able to come back, not to Kesteven."

"We?"

"Yes, we. They're our children, and this is our home."

"One means nothing without the other."

"I don't know," she said, deeply troubled. "What's to make the *Cranborne* crew stick to the agreement once we cast off?"

"What's to stop us stealing their whole ship?" Luca replied wearily. "We have a civilization again, darling. It's not the best, I know that. But it's here, and it works. At least we can see treachery and dishonesty coming a long way off."

"All right. So do you want to go? It's not as if we haven't got enough troubles," she said guiltily, flicking a glance at the diplomatically quiet Lionel.

"I don't know. I want to fight this; going means Grant has won."

"It's not a battle, it's a matter of the heart."

"Whose heart?" he whispered painfully.

"Excuse me," Lionel said. "Have you considered that the people possessing your daughters might not be exactly wel-

coming? What were you planning on doing anyway? It's not as if you can exorcise them and go walking off into a sunset. They'll be as alien to you as you are to them."

"They're not alien to me," Luca said. He sprang up from the chair, his whole body twitchy. "*Damn it*, I cannot stop worrying about them."

"We're all succumbing to our hosts," Lionel said. "The easiest course is to acknowledge that, at least you'll have some peace then. Are you prepared to do that?"

"I don't know," Luca ground out. "I just don't."

Carmitha ran her fingers along the woman's arm, probing the structure of bone and muscle and tendon. Her eyes were closed as she performed the examination, her mind concentrated on the swirl of foggy radiance that was the flesh. It wasn't just tactile feeling she relied on, cells formed distinct bands of shade, as if she was viewing a very out-of-focus medical text of the human body. Fingertips moved on half an inch, she pushed each one in carefully, as if she were stroking piano keys. Searching an entire body this way took over an hour, and even then it was hardly a hundred per cent effective. Only the surface was inspected. There were a great many cancers which could affect the organs, glands, and marrow; subtle monsters that would go unnoticed until it was far, far too late.

Something moved sideways under her forefinger. She played with it, testing its motion. A hard node, as if a small stone was embedded below the skin. Her mind's vision perceived it as a white blur, sprouting a fringe of wispy tendrils that swam out into the surrounding tissue. "Another one," she said.

The woman's gasp was almost a sob. Carmitha had learned the hard way not to hide anything from her patients. Invariably, they knew of the spike of alarm in her own thoughts.

"I'm going to die," the woman whimpered. "All of us are dying, rotting away. It's our punishment for escaping the beyond."

"Nonsense, these bodies are geneered, which makes them highly resistant to cancer. Once you stop aggravating it with energistic power it should sink into remission." Her stock verbal placebo, repeated so many times in the days since Butterworth's collapse that she'd begun to believe it herself.

Carmitha continued the examination, moving past the elbow. It was just a formality now. The woman's thighs had been the worst; lumps like a cluster of walnuts where she'd driven away flab to give herself an adolescent glamour-queen's rump. Fear had broken the instinct and desire for sublime youthful splendour. The unnatural punishment of her cells would end. Maybe the tumours really would go into remission.

Luca came knocking on the side of the caravan just as Carmitha was finishing. She told him to stay outside, and waited until the woman had put her clothes back on.

"It'll be all right," she said, and hugged her. "You just have to be you now, and be strong."

"Yes," came the dismal answer.

It wasn't a time for lectures, Carmitha decided. Let her get over the shock first. Afterwards she could learn how to express her inner strength, fortifying herself. Carmitha's grandmother used to place a lot of emphasis on thinking yourself well. "A weak mind lets in the germs."

Luca carefully avoided meeting the woman's tearful eyes as she came down out of the caravan, standing sheepishly to one side.

"Another one?" he asked after she went into the manor.

"Yep," Carmitha said. "Mild case, this time."

"Jolly good."

"Not really. So far we've just seen the initial tumours develop. I'm just praying that your natural high resistance can

keep them in check. If not, the next stage is metastasis, when the cancer cells start spreading through the body. Once that happens, it's over." She just managed to keep her resentment in check; the landowners and town dwellers were descended from geneered colonists, the Romanies had shunned such things.

He shook his head, too stubborn to argue. "How's Johan?"

"His weight's creeping back up, which is good. I've got him walking again, and given him some muscle-building exercises—also good. And he's abandoned his body illusions completely. But the tumours are still there. At the moment his body is still too weak to fight them. I'm hoping that if we can get his general health level up, then his natural defences will kick in."

"Is he fit enough to help run the estate?"

"Don't even consider it. In a couple of weeks, I'll probably ask him to help in my herb garden. That's the most strenuous work therapy I'll allow."

Nothing he did could hide the disappointment in his mind.

"Why?" she asked in suspicion. "What did you want him to do that for? I thought the old estate was working smoothly. I can hardly notice the difference."

"Just an option I'm considering, that's all."

"An option? You're leaving?" The notion startled her.

"Thinking of it," he said gruffly. "Don't tell anyone."

"I won't. But I don't understand, where will you go?"

"To find the girls."

"Oh, Grant," she laid her hand on his arm, instantly sympathetic. "They'll be all right. Even if Louise got possessed, no soul is going to alter her appearance, she's too gorgeous."

"I'm not Grant." He glanced round the courtyard, twitchy and suspicious. "Talk about having an inner demon, though. God, you must be loving this."

"Oh yeah, having a ball, me."

“Sorry.”

“How many have you got?” she asked quietly.

There was a long pause before he answered. “Some down my chest. Arms. Feet, for Christ’s sake.” He grunted in disgust. “I never imagined my feet to be anything different. Why are they there?”

Carmitha hated his genuine puzzlement; Grant’s possessor was making her feel far too sympathetic towards him. “There’s no logic to these things.”

“Not many people know what’s happening, not outside Cricklade. That trader fellow, Lionel: hasn’t got a clue. I envy him that. But it won’t last, people like Johan must be dropping like flies all across the planet. When everyone realises, things are going to fall apart real fast. That’s why I wanted to start the voyage soon. If we have a second wave of anarchy, I might never find where the girls are.”

“We should get some real doctors in to take a look at you. That white fire could be used to burn the tumours away. We’ve all got X-ray sight now. No reason why it couldn’t. Maybe we don’t even need to be that drastic, you can just wish the cells dead.”

“I don’t know.”

“That’s not like you, either of you. Don’t just sit around on your arse, find out. Get a doctor in. Massage and tea won’t help much in the long run, and that’s all I can provide. You can’t leave now, Luca, people accept you as the boss. Use what influence you’ve got to try and salvage this situation. Get them through this cancer scare.”

He let out a long reluctant sigh, then tilted his head, looking at her out of one eye. “You still think the Confederation’s coming to save you, don’t you?”

“Absolutely.”

“They’ll never find us. They’ve got two universes to search through.”

“Believe what you have to. I know what’s going to happen.”

“Friendly enemies, huh? You and me?”

“Some things never change, no matter what.”

He was saved from trying to get in a cutting reply by a stable hand running out into the courtyard, yelling that a messenger was coming from the town. He and Carmitha went through the kitchen and out through the manor’s main entrance.

A woman was riding a white horse up the drive. The pattern of thoughts locked inside her skull was familiar enough to both of them: Marcella Rye. Her horse’s gallop was matched by the excitement and trepidation in her mind.

She came to a halt in front of the broad stone stairs leading up to the marble portico and dismounted. Luca took the reins, doing his best to soothe the agitated beast.

“We’ve just had word from the villages along the railway,” she said. “There’s a bunch of marauders heading this way. Colsterworth council respectfully requests, and all that bullshit. Luca, we need some help to see the bastards off. Apparently they’re armed. Raided an old militia depot on the outskirts of Boston, got away with rifles and a dozen machine guns.”

“Oh, this is fucking brilliant,” Luca said. “Life here just keeps getting better and better.”

Luca studied the train through his binoculars (genuine ones, handed down to Grant by his father). He was sure it was the same one as before, but there had been changes. Four extra carriages had been added, not that anyone travelled in comfort. This was an iron battle wagon whose armour plates (genuine, Luca thought) ran along its entire length, riveted crudely around ordinary carriages. It clanked along the rail track towards Colsterworth at an unrelenting thirty miles an hour. Bruce Spanton had finally managed to turn the concept of an irresistible force into a physical entity, putting it down

straight into Norfolk's Turneresque countryside where it didn't belong.

"There's more of them this time," Luca said. "I suppose we could roll the rails up again."

"That monstrosity isn't built for reversing," Marcella said grimly. "You have to turn the minds around, their tails will follow."

"Between their legs."

"You got it."

"Ten minutes till they get here. We'd better get people into position and dream up a strategy." He'd brought nearly seventy estate workers with him from Cricklade. The announcement by Colsterworth Council had resulted in over five hundred townsfolk volunteering to fight off the marauders. Another thirty or so had gathered from outlying farms, determined to protect the food they'd worked hard to gather. All of them had brought shotguns or hunting rifles from their adopted homes.

Luca and Marcella organized them into four groups. The largest, three hundred strong, were formed up in a horseshoe formation surrounding Colsterworth station. Two outlying parties were hanging back from the cusps, ready to swarm across the rail and encircle the marauders. The remainder, three dozen on horseback, made up a cavalry force ready to chase down anyone who escaped from the attack.

They spent the last few minutes walking along the ranks, getting them into order and making sure they had all hardened their clothes into bullet-proof armour. Real gunshots were harder to ward off in this realm. Carbosilicon-reinforced flak-jackets were the popular solution, making the front line take on the appearance of a police riot brigade from the mid-Twenty-first Century.

"It's our right to exist as we choose that we're standing for," Luca told them repeatedly as he walked along, inspecting his troops. "We're the ones who've made something of

these circumstances, built a decent life for ourselves. I'll be buggered if I'm going to let this rabble wreck that. They cannot be allowed to live off us, that makes us nothing more than chattel."

Everywhere he went, he received murmurs and nods of agreement. The defenders' resolution and confidence expanded, building into a physical aura which began to tint the air with a hearty red translucence. When he took up position with Marcella they simply grinned at each other, relishing the fight. The train was only a mile out of town now, coming round the last bend onto the straight leading to the station. It tooted its whistle in an angry defiant blast. The red haze over the station glowed brighter. A crack split open along the middle of the wooden sleepers, starting five yards from Luca's feet and extending out past the end of the platforms. It opened barely six inches, and halted, quivering in anticipation. Granite chippings trickled over the edges, to be swallowed silently by the abyssal darkness which had been uncovered.

Luca stared directly at the front of the train, facing down its protruding cannon barrels. "Just keep coming, arsehole," he said quietly.

Subtlety simply wasn't an option. Both sides knew the rough strengths and position of the other. It could never be anything other than a direct head-to-head confrontation. A contest of energistic strength and imagination, with the real guns an unwelcome sideshow.

Half a mile from the station, and the train slowed slightly. The rear two carriages detached and braked to a halt amid fantails of orange sparks from their locked wheels. Their sides hinged down to form ramps, and jeeps raced down onto the ground. They'd been configured into armour-plated dune buggies with thick roll bars; huge deep-tread tyres were powered from four-litre petrol engines that spurted filthy exhaust fumes out into the air with a brazen roar. Each one had a machine gun mounted above the driver, operated

by a gunner dressed in leather jacket with flying goggles and helmet.

They sped away from the carriages in an attempt to outflank the townie defenders. Luca gave a signal to his own cavalry. They charged out into the fields, heading to intercept the jeeps. The train kept thundering onwards.

“Get ready,” Marcella shouted.

Puffs of white smoke shot out from the train’s cannon. Luca ducked down in reflex, hardening the air around himself. Shells started to explode at the end of the station, thick plumes of earth smearing the blank skyline amid bursts of orange light. Two struck the fringe of red air, detonating harmlessly twenty yards above the ground. Shrapnel flew away from the protective boundary. A cheer rang out from the defenders.

“We got ’em,” Luca growled triumphantly.

Machine gun fire rattled across the fields as the jeeps raced round in tight curves, churning up furrows of mud. They drove straight through gates, bursting the timber bars apart with a flash of white light. Horses cantered after them, jumping the hedges and walls effortlessly. Their riders were shooting from the saddle, as well as flinging bolts of white fire. The jeep engines started to cough and stutter as fluxes of energetic power played hell with the power cells encased deep within the semisolid illusion.

The train was only a quarter of a mile away now. Its cannon were still firing continuously. The land beyond the end of the station was taking the full brunt of the impact: craters erupted continuously, sending soil, grass, trees, and stone walls ploughing through the air. Luca was surprised at the diminutive size of the craters, he’d expected the shells to be more powerful. They did produce a lot of smoke, though; thick grey-blue clouds churning frenetically against the sheltering bubble of redness. They almost obscured the train from view.

Luca frowned suspiciously at that. “They could be a

cover,” he shouted at Marcella above the bass thunder of exploding shells.

“No way,” she yelled back. “We can sense them, remember. Smoke screens don’t work here.”

Something was wrong, and Luca knew it. When he switched his attention back to the train, he could sense the note of triumph emanating from it, just as strong as his own. Yet nothing the marauders had done assured them of victory. Nothing he could perceive.

Layers of smoke from the shells were creeping sluggishly towards the station. As they slithered through the edge of the red light they gleamed with a dark claret phosphorescence. People in the reserve groups clustered outside the platforms were reacting strangely as the first wisps curled and flexed around them. Waving their hands in front of their faces as if warding off a mulish wasp, they began to stagger around. Ripples of panic raced out from their minds, impinging against those close by.

“What’s happening to them?” Marcella demanded.

“Not sure.” Luca watched the slow spread of the crimson smoke. Its behaviour was perfectly natural, fronds undulating and twisting about on the currents of air. Nothing directed it, no malicious energetic pressure, yet wherever it spread chaos ensued. He took time to make the appalling connection; even telling himself Spanton would delve as low as it was possible to go, he found it hard to credit such depravity.

“Gas,” he said, dumbfounded. “That’s not smoke. The bastard’s using gas!”

Machine guns and rifles opened fire from every slot cut into the train’s armoured sides. With the defenders distracted, bullets were able to slice nonchalantly through the rosy air. The front rank of townsfolk were punched backwards as bullets hammered into their flak jackets. Abruptly, there was no more pink air. The human survival instinct was too strong, everyone concentrated on saving themselves.

“Blow it back at them!” Luca bellowed across the commotion. The train was only a few hundred yards away now, pistons growling furiously as it slid remorselessly along the track towards him. He flung his hands out and shoved at the air.

Marcella followed suit. “Do it,” she shouted at the closest townsfolk. “Push!”

They began to imitate her, sending out a stream of energetic power to repel the air and with it the deadly gas. The idea spread fast among the defenders, becoming real as soon as it was thought of. They didn’t need to act, only to think.

Air began to move, groaning over the station walls as it sped above the rails, its speed increasing steadily. The pillars of smoke began to bend away from their craters, breaking into tufts which slid away towards the approaching train. Leaves and twigs from the macerated hedges were picked up and carried along by the wind. They broke harmlessly against the black iron prow of the train, fluffing round it in an agitated slipstream.

Luca yelled in wordless exultation, adding the air from his lungs to the torrent surging past his body. It had risen to gale force, pushing at him. He linked arms with his neighbours, and together they rooted themselves in the ground. Unity of purpose had returned, bringing them an unchallenged mastery of the air. Now the flow had begun, they started to shape it, narrowing its force to howl vengefully against the train. Hanging baskets along the platforms swung up parallel to the ground, tugging frantically at their brackets.

The train slowed, braked by the awesome force of the horizontal tornado hurled against it. Steam from its stack and leaky junctions was ripped away to join the hurtling streamers of lethal gas. The marauders couldn’t keep their rifles steady; the wind tore at them, twisting and shaking until they threatened to wrench free. Cannon barrels were pushed out of alignment. They’d already stopped firing.

All of the defenders were contributing their will to the

raging wind now; directing it square against the train and bringing it to a shuddering halt a hundred yards from the station. Then they upped the force; adrenaline glee providing further inspiration. The iron beast rocked, the weight of its thick cladding counting for nothing.

“We can do it,” Luca cried, his words ripped away by the supernatural wind. “Keep going.” It was a prospect shared by all, encouraged by the first creaking motion of the great engine’s frame.

The marauders inside turned their own energistic power to anchoring themselves. They didn’t have the numbers to win any trial of strength.

Lumps of granite from the rail track collided against the train. The rails themselves were torn up to smash against the engine, wrapping themselves around the boiler.

One set of wheels along the side of the engine left the ground. For a moment the machine hung poised on the remaining wheels as those inside strove to counter the toppling motion. But the defending townsfolk refused to release the maelstrom they’d created, and the metal bogies buckled. The engine crashed onto its side, twisting the carriage directly behind it through ninety degrees.

If it had been a natural derailment, that would have been the end of it. In this case, the townsfolk kept on pushing. The engine flipped again, pointing its crushed bogies directly into the sky. Vicious jets of steam poured out of the broken pistons, only to be dissolved by the gale. Again the engine turned as the hurricane clawed at its black flanks, trawling the remaining carriages along. Its momentum was picking up now, turning the motion into a continuous roll. The links between the carriages snapped apart. They scattered across the fields, bulldozing through any trees that got in their way and skidding down into ditches where they came to a jarring halt.

The engine just kept on rolling, impelled by the wind and thoughts of its intended victims. Eventually the boiler broke

open, severing the big machine's spine. A cloud of steam exploded out from the huge rent, vanishing quickly into the caterwauling sky to be replaced by an avalanche of debris. Fragments of very modern-looking machinery tumbled down over the ruined land. All illusion of the steam-powered colossi had expired, leaving one of the Norfolk Railway Company's ordinary eight-wheel tractor units buried in the soil.

With the wind stilled, Luca left Marcella to organize medic parties for the defenders who'd succumbed to the gas. Even now, a dangerous chemical stink prowled around the shell craters. Those who claimed knowledge of such matters said it could be a type of phosphor, or possibly chlorine, maybe something even worse. The names they gave it didn't bother Luca, only the intent behind it. He'd walked along the row of casualties, grimacing at the protruding eyes that wept tears of salty water and blood in equal quantities; tried to speak reassuring words over the terrible hacking coughs.

After that, there could be no doubt what had to be done.

He'd gathered a small band of estate workers to accompany him. Remembering his first encounter with Spanton, he headed over the fields to the wrecked engine.

Metal sheets of some kind had indeed been welded over the tractor unit's body. Not iron after all, just some lightweight construction material; a framework easily moulded into thick armour in the mind of the beholder. They'd suffered considerably from the sheer brutality of the wind. Some of the cannon barrels had broken off, while the remainder were mangled. The main body of the unit had bent itself into a lazy V, with the forward end wedged down into the ground.

Luca walked round to the cab. It had crumpled badly, sides bowing inwards and roof concave, reducing the space inside to less than that of a wardrobe. He crouched down and peered through the crooked window slit.

Bruce Spanton stared back at him. His body was trapped between various chunks of metal and warped piping that had sprung from the walls. Blood from his crushed legs and arm mingled with oil and muddy soil. His face was the pale grey of shock victims, with different features than before. The wraparound sunglasses had been discarded along with the swept-back hair; no illusion remained.

“Thank Christ,” he gasped. “Get me outta here, man. It’s all I can do to stop my fucking legs from dropping off.”

“I thought I’d find you in here,” Luca replied equitably.

“So you found me. So I’ll give you a fucking medal. Just get me out. These walls all got smashed to shit in the rumble. It hurts so bad I can’t even switch off the pain like usual.”

“A rumble? Is that what this was?”

“What are you trying to pull!” Spanton screamed. He stopped, grimacing wildly from the pain which his outburst triggered. “All right, okay. You won. You’re the king of the hill. Now bend some of this metal away.”

“That’s it?”

“That’s *what*?”

“We won, you lose. It’s over?”

“What do you fucking think, dickhead?”

“Ah. I get it. You walk off into the sunset and never come back. That’s it. The end. No hard feelings. Everything turned out okay, and you’ll just slaughter some other bunch of people with poison gas. Maybe a smaller town, who won’t be able to fight back. Well great. Absolutely fabulous. That’s why I came out to help this town. So you could have your rumble and turn your back on us.”

“What do you fucking want?”

“I want to live. I want to be able to look out at the end of the day and see what I’ve accomplished. I want my family to benefit from that. I want them to be safe. I don’t want to have them worry about insane megalomaniacs who think being tough entitles them to live off the backs of ordinary

decent working people.” He smiled down at Spanton’s stricken face. “Am I ringing any bells here? Do you see yourself in any of that?”

“I’ll go. Okay? We’ll get off this island. You can put us on a ship, make sure we really leave.”

“It’s not where you are that’s the problem. It’s *what* you are.” Luca straightened up.

“What? That’s it? Get me out of here, you shit.” He started thumping the walls with a fist.

“I don’t think so.”

“You think I’m a problem now, you don’t even know what a problem is, asshole. I’ll show you what a real goddamn motherfucking problem is.”

“That’s what I thought.” Luca swung his pump action shotgun round until the muzzle was six inches from Spanton’s forehead. He kept firing until the man’s head was blown off.

Bruce Spanton’s soul slithered up out of his bloody corpse along with the body’s true soul; an insubstantial wraith rising like lethargic smoke out of the train’s wreckage. Luca looked straight into translucent eyes that suddenly realized actual death was occurring after centuries of wasted half-existence. He held that gaze, acknowledging his own guilt as the writhing spectre slowly faded from sight and being. It took mere seconds, a period which compressed a lifetime of bitter fear and aching resentment into its length.

Luca stood shivering from the profound impact of knowledge and emotion. I did what I had to do, he told himself. Spanton had to be stopped. To do nothing would be to destroy myself.

The estate workers were watching him cautiously, their thoughts subdued as they waited to see what he did next.

“Let’s go round up the rest of them,” Luca said. “Especially that bastard chemist.” He started walking towards the

nearest carriage, thumbing new cartridges into the pump action's empty chamber.

The others began to trail after him, holding their weapons tighter than before.

Cricklade hadn't known screams like it since the day Quinn Dexter arrived. A high-pitched note of uniquely female agony coming from an open window overlooking the courtyard. The becalmed air of a bright early-autumn day helped carry the sound a long way over the manor's steep rooftops, agitating the stabled horses and causing men to flinch guiltily.

Véronique's waters had broken in the early hours the day after Luca had led his band of estate workers away to help fight the marauders. Carmitha had been with her since day-break, closeted away in one of the West Wing's fancy bedroom suites. She suspected the room might even have belonged to Louise; it was grand enough, with a large bed as the central feature (though not big enough to qualify as a double; that would never do for a single landowner girl). Not that Louise would want it now.

Véronique was propped up on the middle of the mattress, with Cook dabbing away at her straining face with a small towel. Other than that, it was all down to Véronique and Carmitha. And the baby, who was reluctant to put in a fast appearance.

At least Carmitha's new-found sense allowed her to see that it was the right way round for the birth, and the umbilical cord hadn't got wrapped round its neck. Nor were there any other obvious complications. Basically, that just left her to look, sound, and radiate assured confidence. She had after all assisted with a dozen natural childbirths, which was a great comfort to everyone else involved. Somehow, what with the way Véronique looked up to her as a cross between her long-lost mother and a fully qualified gynaecologist,

she'd never actually mentioned that assistance involved handing over towels when told and mopping up for the real midwife.

"I can see the head," Carmitha said excitedly. "Just trust me now."

Véronique screamed again, trailing off into an angry whimper. Carmitha placed her hands over the girl's swollen belly, and exerted her energistic power, pushing with the contractions. Véronique kept on screaming as the baby emerged. Then she broke into tears.

It happened a lot quicker than usual thanks to the energistic pressure. Carmitha caught hold of the infant and eased gently, making the last moments more bearable for the exhausted girl. Then it was the usual fast panic routine of getting the umbilical tied and cut. Véronique sobbing delightedly. People moving in with towels and smiles of congratulations. Having to wipe the baby off. Delivering the placenta. Endless mopping up.

New to this was applying some energistic power to repair the small tears in Véronique's vaginal walls. Not too much, Carmitha was still worried about the long-term effects which even mild healing might trigger. But it did abolish the need for stitches.

By the time Carmitha finally finished tidying up, Véronique was lying on clean sheets, cradling her baby daughter with a classic aura of exhausted happiness. And a smooth mind.

Carmitha studied her silently for a moment. There was none of the internal anguish caused by a possessing soul riding roughshod over the host. Sometime during the pain and blood and joy, two had become one, merging at every level in celebration of new life.

Véronique smiled shyly upwards at Carmitha. "Isn't she wonderful?" she entreated of the drowsy baby. "Thank you so much."

Carmitha sat on the edge of the bed. It was impossible not to smile down at the wrinkled-up face, so innocent of its brand-new surroundings. “She’s lovely. What are you going to call her?”

“Jeanette. Both our families have had that name in it.”

“I see. That’s good.” Carmitha kissed the baby’s brow. “You two get some rest now. I’ll pop by in an hour or so to check up on you.”

She walked through the manor out into the courtyard. Dozens of people stopped her on the way; asking how it had gone, were mother and child all right? She felt happy to be dispensing good news for once, helping to lift some of the worry and tension that was stifling Cricklade.

Luca found her sitting in the open doorway at the back of her caravan, taking long drags from a reefer. He leant against the rear wheel and folded his arms to look at her. She offered him the joint.

“No thanks,” he said. “I didn’t know you did that.”

“Just for the occasional celebration. There’s not much weed about on Norfolk. We have to be careful where we plant it. You landowners get very uptight about other people’s vices.”

“I’m not going to argue with you. I hear the baby arrived.”

“She did, yes, she’s gorgeous. And so is Véronique, now.”

“Now?”

“She and Olive kissed and made up. They’re one now. One person. I guess that’s the way the future’s going for all of you.”

“Ha!” Luca grunted bitterly. “You’re wrong there, girl. I killed people today. Butterworth’s right to fear his health. Once your body goes in this realm, you go with it. There’s no ghosts, no spirits, no immortality. Just death. We screwed up—lost our one chance to go where we wanted, and we didn’t go there.”

Carmitha exhaled a long stream of sweet smoke. "I think you did."

"Don't talk crap, my girl."

"You're back where we thought the human race started from. What exists here is all we had before people began inventing things and making electricity. It's the kind of finite world humans feel safe in. Magic exists here, though it's not good for much. Very few machines work, nothing complicated, and certainly no electronics. And death . . . death is real. Hell, we've even got gods on the other side of the sky again; gods with powers beyond anything possible here, made in our own image. In a couple of generations, we'll only have rumours of gods. Legends that tell how this world was made, racing out of the black emptiness in a blaze of red fire. What's that if it's not a new beginning in a land of innocence? This place isn't for you, it never was. You've reinvented the biological imperative, and made it mean something this time. All that you are must carry on through your children. Every moment has to be lived to the full, for you'll get no more." She took another drag, the end of the joint glowing bright tangerine. Small sparks were reflected in her gleeful eyes. "I rather like that, don't you?"

Stephanie's bullet wound had healed enough to let her walk round the headland camp; she and Moyo and Sinon made the circuit twice a day. Their small secluded refuge had grown in a chaotic manner as the deserters from Ekelund's army dribbled in. Now it sprawled like an avalanche of sleeping bags away from the cliff edge. The new people tended to stay in small groups, huddling together round the pile of whatever items they'd brought with them. The only rule the serjeants had about extending sanctuary from Ekelund was that they hand over their real weapons once they arrived. Nobody had objected enough to return.

As she circled round the knots of subdued people,

Stephanie picked up enough fragments of conversation to guess what awaited any deserter foolish enough to venture back. Ekelund's paranoia was growing at a worrying rate. And Tinkerbell's appearance hadn't helped. Apparently, the crystal entity had been shot at. That was the reason for it fleeing away into the empty glare.

As if they didn't have enough to worry about with their current predicament, there was now the prospect Ekelund had started a war.

"I miss him, too," Moyo said sympathetically. He squeezed Stephanie's hand in an attempt at reassurance.

She smiled faintly, thankful he'd picked up on her melancholic thoughts. "A couple of days without him, and we're all going to pieces." She paused to take a breath. Perhaps her recovery wasn't as advanced as she liked to imagine. "Let's go back," she said. These little walks had started out to give the newcomers some sense of identity, that they were all part of a big new family. She was the one they'd come to, and she wanted to show she was available to them if they needed it. Most of them recognized her as she walked past. But there were so many now that they had their own identity, and it was the serjeants who guaranteed their safety. Her role had diminished to nothing. And God forbid I should try to manufacture my own importance like Ekelund.

The three of them turned and headed back to the little encampment where their friends kept a vigil over Tina. A little way beyond it, the serjeants formed a line of watchers strung out along the top of the cliff, searching for any sign of Tinkerbell. They covered almost a fifth of the rim now, and Sinon told her their mini-consensus was considering stationing them all the way round the island. When she'd asked if Ekelund might consider that a threatening move, the big bitek construct merely shrugged. "Some things are considerably more important than placating her neuroses," he'd said.

“Quick inspection tour,” Franklin remarked as they returned.

Stephanie guided Moyo to a comfortable sitting position a couple of metres from Tina’s makeshift bed and sprawled on a blanket beside him. “I’m not exactly an inspiring sight any more.”

“Of course you are, darling,” Tina said.

Everyone had to strain to hear her. She was in a bad way now. The serjeants, Stephanie knew, had basically given up and were just making what they considered her last days as comfortable as possible. Even though Rana rarely even let go of her friend’s hand, she didn’t exert any energistic power other than a general wish for Tina to mend. Active interference with the woman’s crushed organs would probably only make things worse. Tina didn’t have the willpower to maintain any form of body illusion any more. Her dangerously pale skin was visible for anyone to see as she laboured for air. The stopgap intravenous tube was still feeding fluid into her arm, though her body seemed determined to sweat it out at a faster rate.

They all knew it wouldn’t be long now.

Stephanie was furious with herself for wondering what would happen. If Tina’s soul would migrate back to the beyond, or be trapped here; or if she’d simply and finally die. A legitimate enough interest given their situation. But Stephanie was sure Tina would pick up the pulse of guilt in her mind.

“We’re still attracting Ekelund’s discards,” she said. “At this rate everyone will be camping here with us in another week.”

“What week?” McPhee grumbled softly. “Can you no’ feel the air fouling?”

“The carbon dioxide level is not detectable at this moment,” Choma said.

“Oh? And what are you lot doing to help right now?”

McPhee indicated the line of stationary serjeants standing along the cliff. "Other than making that madwoman more paranoid."

"Our efforts continue," Sinon said. "We are still trying to formulate a method of opening a wormhole, and our observation role has been increased."

"Putting our hopes on a bloody fairy! This place must be making us all soft in the head."

"That term is a misnomer, though a perfectly understandable one for Cochrane to use."

"I guess that means you still haven't figured out what it was," Moyo said.

"Unfortunately not. Though the fact that some kind of intelligence exists here is an encouraging development."

"If you say so." He turned away.

Stephanie snuggled up closer to Moyo, enjoying the reflex way his arm went round her shoulders. Being together made the awful wait a tiny bit more tolerable. She just couldn't work out what she wanted to happen first. Though they'd not spoken of it, the serjeants would probably try to open a wormhole back to Mortonridge. As a possessed, it would hardly be a rescue for her. Perhaps staying here until the carbon dioxide built to a lethal level was preferable.

She flicked another guilty glance at Tina.

Three hours later, the wait ended. This time the serjeants saw it coming. A riot of tiny dazzling crystals swooped out around the base of the flying island to rush up vertically. They erupted over the top of the cliff like a silent white firestorm. Thousands of them curved in mid air and cascaded downwards to spread out above the headland camp, slowing to hover just over the heads of the astounded humans and serjeants.

The light level was quadrupled, forcing Stephanie to shield her hand with her eyes. Not that it did much to protect

her from the vivid scintillations. Even the drab ground was sparkling.

“Now what?” she asked Sinon.

The serjeant watched the swirl of crystals drifting idly, sharing what he saw with the others. There was no real pattern to their movement. “I have no idea.”

They are watching us as we watch them, Choma said. They have to be probes of some kind.

It is likely, Sinon said.

Something is coming, the serjeants along the cliff warned. A disc of raw light was expanding out from underneath the island. Not that it could have been hidden there, it was well over a hundred kilometres in diameter. The emergence effect was similar to an Adamist starship’s ZTT jump, but much much slower.

Once it had finished distending, it began to rise up parallel to the cliff. A cold, brilliant sun slid over the horizon to fill a third of the sky. It wasn’t a solid sphere, snowflake geometries fluctuated behind the overpowering glare.

The small crystals parted smoothly, racing away over the landscape, leaving nothing between the headland camp and the massive visitor. Fountains of iridescence erupted deep inside it, mushrooming open against the prismatic surface. Streaks and speckles shimmered and danced around each other, striving for order within the huge blemish.

It was the sheer size of the image they melded into which defeated Stephanie for some time. Her eyes simply couldn’t accept what she was seeing.

Cochrane’s face, thirty kilometres high, smiled down at them.

“Hi, guys,” he said, “Guess what I found.”

Stephanie started laughing. She used the back of her hand to smear tears across her cheeks.

The crystal sphere drifted in towards Ketton island, dimming slightly as it came. When it was a few metres from the

cliff, a tiny circular section darkened completely, and receded inside in a swift fluidic motion.

At Cochrane's urging, Stephanie and her friends, along with Sinon and Choma, stepped through the opening. The tubular tunnel had smooth walls of clear crystal, with thin green planes bisecting the bulk of the material around it. After a hundred metres it opened out into a broad lenticular cavern a kilometre wide. Here, the long fractures of light beneath their feet glimmered crimson, copper, and azure, intersecting in a continual filigree that melted away into the interior. There was no sign of the fearsome light emitted by the outer shell, yet they could see out. Ketton island was clearly visible behind them, distorted by the compacted facets of crystal.

One of the red sheets of light fissuring the cavern wall began to enlarge, the crystal conducting it withdrawing silently. Cochrane walked out of the opening, grinning wildly. He whooped and rushed over to his friends. Stephanie was crushed in his embrace.

"Man! It is good to see you again, babe."

"You, too," she whispered back.

He went round the rest of the group, greeting them exuberantly; even the serjeants got high fives.

"Cochrane, what the hell is this thing?" Moyo asked.

"Don't you recognize her?" the hippie asked in mock surprise. "This is Tinkerbelle, dude. Mind you, she inverted, or something like that, since you saw us last."

"Inverted?" Sinon asked. He was gazing round the chamber, sharing his sight with the serjeants outside.

"Her physical dimension, yeah. There's a whole load of real groovy aspects to her which I don't really dig. I think, if she wants, she can get a lot bigger than this. Cosmic thought, right?"

"But what is she?" Moyo asked impatiently.

"Ah." Cochrane gestured round uncertainly. "The infor-

mation has been kinda flowing mostly one way. But she can help us. I think.”

“Tina’s dying,” Stephanie said abruptly. “Can anything be done to heal her?”

Cochrane’s bells tinkled quietly as he shuffled about. “Well sure, man, no need to shout. I’m awake to what’s going down.”

“The smaller crystals are gathering around Tina,” Sinon reported, looking at what he could see through the serjeants tending the invalid. “They appear to be encasing her.”

“Can we talk to this Tinkerbell directly?” Choma asked.

“You may,” a clear directionless female voice said.

“Thank you,” the serjeant said sombrely. “What are you called?”

“I have been named Tinkerbell, in your language.”

Cochrane twisted under the stares directed at him. “What?”

“Very well,” Choma said. “Tinkerbell, we’d like to know what you are, please.”

“The closest analogy would be that I have a personality like an Edenist habitat multiplicity. I have many divisions; I am singular as I am manifold.”

“Are the small crystals outside segments of yourself?”

“No. They are other members of my race. Their physical dynamic is in a different phase from mine, as Cochrane explained.”

“Did Cochrane explain to you how we got here?”

“I assimilated his memories. It has been a long time since I encountered an organic being, but no damage was incurred to his neural structure during the reading procedure.”

“How could you tell?” Rana muttered. Cochrane gave her a thumbs up.

“Then you understand our predicament,” Stephanie said. “Is there a way back to our universe?”

“I can open a gateway back to it for you, yes.”

“Oh God.” She sagged against Moyo, overwhelmed with relief.

“However, I believe you should resolve your conflict first. Before we began our existence in this realm, we were biological. Our race began as yours; a commonality which permits me to appreciate the ethics and jurisprudence that you observe at your current level of evolution. The dominant consciousness has stolen these bodies. That is wrong.”

“So’s the beyond,” McPhee shouted. “You’ll no’ make me go back there without a fight.”

“That will not be necessary,” Tinkerbell said. “I can provide you with several options.”

“You said you used to be biological beings,” Sinon said. “Will we all evolve into your current form in this realm?”

“No. There is no evolution here. We chose to transfer ourselves here a long time ago. This form was specifically engineered to sustain our consciousness in conjunction with the energy pattern which is the soul. We are complete and essentially immortal now.”

“Then we were right,” Moyo said. “This realm is a kind of heaven.”

“Not in the human classical religious sense,” Tinkerbell said. “There are no city kingdoms with divine creatures tending them, nor even levels of ecstasy and awareness for your souls to rise through. In fact, this realm is quite hostile to naked souls. The energy pattern dissipates rapidly. You are capable of dying here.”

“But we wanted a refuge,” McPhee insisted. “That’s what we imagined when we forced the way open to come here.”

“A wish granted in essence if not substance. Had you arrived with an entire planet to live on, then its atmosphere and biosphere would sustain you for thousands of generations; at least as long as it would orbiting a star. This realm is about stability and longevity. That’s why we came here.

But we were prepared for our new life. Unfortunately, you came here on a barren lump of rock.”

“You speak of change,” Sinon said. “And you know of souls. Is your kind of existence the answer to our problem? Should our race learn how to transform itself into an entity like you?”

“It is an answer, certainly. Whether you would be ready to sacrifice what you have to achieve our actuality, I would doubt. You are a young species, with a great deal of potential ahead of you. We were not. We were old and stagnant; we still are. The universe of our birth holds no mysteries to us. We know its origin and its destination. That is why we came here. This realm is harmonious to us; it has our tempo. We will wait out our existence here, observing what comes our way. That is our nature. Other races and cultures would take the path to decadence or transcendence. I wonder which you will select when it is your time?”

“I like to think transcendence,” Sinon said. “But as you say, we are a younger, less mature race than you. Dreaming of such a destiny is inevitable for us, I suggest.”

“I concede the point.”

“Can you tell us of a valid answer to the problem of possession we currently face, how we can send our souls safely through the beyond?”

“Unfortunately, the Kiint were correct to tell you such a resolution must come from within.”

“Do all races who have resolved the question of souls apply this kind of moral superiority in their dealings with inferior species?”

“You are not inferior, merely different.”

“Then what are our options?” Stephanie asked.

“You can die,” Tinkerbelle said. “I know you have all expressed a wish for that. I can make it happen. I can remove your soul from the body it possesses, which will allow this

realm's nature to take its course. Your host will be restored, and can return to Mortonridge."

"Not too appealing," she said shakily. "Anything else?"

"Your soul would be welcome to join me in this vessel. You would become part of my multiplicity."

"If you can do that, then just give each of us our own vessel."

"While we are effectively omnipotent within this realm, that ability is beyond us. The instrument which brought us here, and assembled our current vessels, was left behind in your universe long ago. We had no further use for it, so we thought."

"Can't you go back?"

"Theoretically, yes. But intent is another thing. And we don't know if the instrument still exists. Moreover, you would probably be unable to adapt to such a vessel by yourself; our psychology is different."

"None of those are very attractive," she said.

"To you," Choma interjected quickly. "To most of the serjeants, transferring ourselves into a new style of multiplicity is very attractive."

"Which opens up a further option," Tinkerbelle said. "I can also transfer your souls into the empty serjeant bodies."

"That's better," Stephanie said. "But if we go back, even in serjeant bodies, we'll still wind up in the beyond at some later time."

"That depends. Your race may decide how to deal with souls that become trapped in the beyond before that happens."

"You're giving us a lot of credit. Judging by our current record, I'm not sure we deserve it. If you can't shoot it, people aren't interested."

"You are being unfair," Sinon said.

"But honest. The military mind has infiltrated government for centuries until they became one," Rana said.

“Don’t start,” Cochrane grunted. “This is like important, you dig?”

“I don’t pretend to predict what will come,” Tinkerbell said. “We abandoned that arrogance when we came here. You seem to be determined. That usually suffices.”

“Did you come here purely to circumvent the beyond?” Sinon asked. “Was this your racial solution?”

“Not at all. As I said, we are an old species. While we were still in our biological form we evolved into a collective of collectives. We gathered knowledge for millennia, explored galaxies, examined different dimensional realms co-existing with our own universe—everything a new race does as fresh insights and understanding open up. Eventually there was nothing original for us, only variations on a theme that had been played a million times before. Our technology was perfect, our intellects complete. We stopped reproducing, for there was no longer any reason to introduce new minds to the universe; they could only ever have heritage, never discovery. At such a point some races die out contentedly, releasing their souls to the beyond. We chose this transference, the final accomplishment for our technological mastery. An instrument capable of moving the consciousness from a biological seat to this state was a challenge even for us. You can only sense the physical aspects of this vessel, and even those can be at variance with what you understand. As I think you realize.”

“Why bother with an instrument? We came here by willpower alone.”

“The energistic power you have is extremely crude. Our vessels cannot even exist fully in the universe, the energy patterns they support have no analogue there. Their construction requires a great deal of finesse.”

“What about others? Have you discovered any life forms here?”

“Many. Some like us, who have abandoned the universe.

Some like you, thrown here by chance and accident. Others which are different again. There are visitors, too, entities more accomplished than we, who are charting many realms.”

“I think I would like to see them,” Choma said. “To know what you do. I will join you if I may.”

“You will be welcome,” Tinkerbelle said. “What of the rest?”

Stephanie glanced round her friends, trying to gauge their reaction to the offers Tinkerbelle had made. Apprehension persisted in all of them, they were waiting for her lead. Again.

“Are there any other humans here?” she asked. “Any planets?”

“It is possible,” Tinkerbelle said. “Though I have not encountered any yet. This realm is one of many which has the parameters you desired.”

“So we can’t seek refuge anywhere else?”

“No.”

Stephanie took Moyo’s hand in hers and pulled him close. “Very well, time to face the music, I suppose.”

“I love you,” he said. “I just want to be with you. That’s my paradise.”

“I won’t choose for you,” she told the others. “You must do that for yourselves. For myself, if a serjeant body is available I will take it and return to Mortonridge. If not, then I’ll accept death here in this realm. My host can have her body and freedom back.”

24

To a civilization innocent of regularised interstellar travel, the arrival of a single starship could never be viewed as a threat in itself. What it represents, the potential behind it, however, is another matter. A paranoid species could react very badly indeed to such an event.

It was a factor Joshua kept firmly in mind when *Lady Mac* emerged from her jump a hundred thousand kilometres above the diskcity. The crew did nothing for the first minute other than running a passive sensor sweep. No particle or artefact was drifting nearby, and no detectable xenoc sensor locked on to the hull.

“That original radar pulse is all I’m picking up,” Beaulieu reported. “They haven’t seen us.”

“We’re in clear,” Joshua told Syrinx. All communication between the two starships was now conducted via affinity, the bitek processor array installed in *Lady Mac*’s electronics suite relaying information to *Oenone* with an efficiency equal to a standard datavise. The bitek starship had searched through the affinity band, its sensitivity stretched to the maximum. It was completely silent. As far as they could tell, the diskcity Tyrathca didn’t have affinity technology.

“We’re ready to swallow in,” Syrinx replied. “Shout if you need us.”

“Okay, people,” Joshua announced. “Let’s go with the plan.”

The crew brought the ship up to normal operational status. Thermo dump panels deployed, radiating the starship’s accumulated heat away from the gleaming photosphere; sensor booms telescoped up. Joshua used the high-resolution systems to make an accurate fix on the diskcity, not using the active sensors yet. Once he’d confirmed their position to within a few metres, he transferred the navigational data over to a dozen stealthed ELINT satellites stored on board. They were fired out of a launch tube, travelling half a kilometre from the fuselage before their ion drives came on, pushing them in towards the diskcity on a pulse of thin blue flame. It would take them the better part of a day to fly within an operational distance when they could start returning useful data on the artefact’s darkside. Joshua and Syrinx considered it unlikely the diskcity could detect them in flight, even if their sensors were focused on space around *Lady Mac*. It was one of the mission’s more acceptable risks.

With the satellites launched, he brought the starship’s active sensors on-line and conducted a sweep of local space.

“We’re now officially here,” he told them.

“Aligning main dish,” Sarha said. She followed the grid image, waiting until the coordinates matched the diskcity.

Joshua datavised the flight computer to broadcast their message. It was a simple enough greeting, a text in the Tyrathca language, spread across a broad frequency range. It said who they were, where they came from, that humans had cordial relations with the Tyrathca from Tanjuntic-RI, and asked the diskcity to return the hail. No mention was made of the *Oenone* being present.

There were bets on how long a reply would take, even of

what it would say, if all they'd get back was a salvo of missiles. Nobody had put money on getting eight completely separate responses beamed at them from different sections of the diskcity.

"Understandable, though," Dahybi said. "The Tyrathca are a clan species, after all."

"They must have a single administration structure to run an artefact like that," Ashly protested. "It wouldn't work any other way."

"Depends what's tying them together," Sarha said. "Something that size can hardly be the most efficient arrangement."

"Then why build it?" Ashly wondered.

Oski ran the messages through their translator program. "Some deviation in vocabulary, syntax and symbology from our Tyrathca," she said. "It has been fifteen thousand years after all. But we have a recognizable baseline we can proceed from."

"Glad to see some sort of change," Liol muttered. "The way everything stays the same with these guys was getting kind of spooky."

"That's drift, not change," Oski told him. "And take a good look at the diskcity. We could build something like that easily; in fact we could probably do a much better job of it like Sarha says. All it demonstrates is expansion, not development. There's been no real technological progress here, just like their colonies and arkships."

"What do the messages say?" Joshua asked.

"One is almost completely unintelligible, some kind of image, I think. The computer's running pattern analysis now. The rest are text only. Two have returned our greeting, and want to know what we're doing here. Two are asking for proof that we're xenocs. Three say welcome, and please rendezvous with the diskcity. Uh, they call it Tojolt-HI."

“Give me a position on the three major friendlies,” Joshua said.

Three blue stars blinked over his neuroiconic image of Tojolt-HI. Two were located in the bulk of the disk, while the other was at the edge. “That settles it,” he said. “We concentrate on the rim source. I don’t want to try and manoeuvre *Lady Mac* anywhere near the interior until we know for sure what’s there. Do we know what that section’s called?”

“The dominion of Anthi-CL,” Oski said.

“Sarha, focus our com beam on them, please, narrow band.”

Joshua ran through the message from the rim to get a feel for the format, and composed a reply.

STARSHIP LADY MACBETH

“What do you think?” Joshua asked.

“Not quite the kind of response you’d get from our Tyrathca,” Samuel said. “It could be their attitude has changed to adapt to their circumstances. They seem to be tinged with avarice.”

“Resources would be scarce here,” Kempster said. “There can be no new sources of solid matter for them to exploit. A kilo of your waste may well be more valuable to them than a thousand fuseodollars.”

“We’ll bear it in mind when we start negotiating,” Joshua said. “For now, we have an invitation. I think we’ll accept.”

“Could be they don’t have traffic control here,” Joshua said. He ran a search through his neural nanonics encyclopaedia file on Hesper-LN. “The Hesper-LN Tyrathca didn’t have any formal control system before they started receiving Confederation ships.”

“You also need to have a lot of ships flying before that kind of arrangement becomes essential,” Ashly said. “We haven’t even detected one ship around Tojolt-HI yet. I’ve been running a constant scan.”

“They’re certainly scanning us in return,” Beaulieu said. “I’m registering seventeen different radar beams focused on us now. And I think there’s some laser radar directed our way, too.”

“No ships at all?” Joshua asked.

“I can’t find any drive emissions down there,” Sarha said. “With our optical sensor resolution, we ought to be able to see even a chemical reaction thruster flame inside that umbra.”

“Maybe they’ve used something like the voidhawk distortion field,” Dahybi suggested. “After all, Kempster said mass was precious to them. Maybe they can’t afford reaction drives.”

“Gravitonic detectors say you’re wrong,” Liol said. “I’m not picking up any kind of distortion pattern in this neck of the woods.”

“They’re not going to tip their hand this early in the game,” Monica said. “They won’t show us what they’ve got, especially if it’s combat capable.”

Sarha shifted under her restraint webbing to frown at the ESA agent. “That’s absurd. You can’t suddenly shut down all your spacecraft traffic the instant you detect a xenoc. You’d leave ships in transit. Besides, they don’t know how long we’ve been watching them.”

“You hope.”

Sarha gave an exasperated sigh. “They don’t have ZTT technology, so the only interstellar ships they can conceive are arkships. And if one of those used its fusion drive to decelerate into this system, they’d be able to track it from half a light-year out. They must be curious about us and how the hell we got here, that’s all.”

“Never mind,” Joshua grumbled.

UNDERSTOOD. EXPECTED RENDEZVOUS TIME 45
MINUTES.
CAPTAIN JOSHUA CALVERT

Joshua datavisised the flight computer to ignite the fusion drives. *Lady Mac* headed in towards the diskcity at a half-gee acceleration. He refined the vector so they'd finish the main burn a hundred kilometres out from the rim. If fusion drives weren't in common use in this system, *Lady Mac*'s exhaust might prove disconcerting. A smile touched his lips at what they'd think of the antimatter drive.

"Joshua," Syrinx called. "We've found another diskcity."

"Where?" he asked. Everyone on *Lady Mac*'s bridge perked up with interest.

"It's trailing Tojolt-HI by forty five million kilometres, inclined two degrees to the ecliptic. Kempster and Renato were right. The odds of us emerging so close to the only inhabited structure are non-existent."

"Jesus, you mean this redoubt civilization is strung out all around the star's equatorial orbit?"

"Looks that way. We're scanning probable locations for more of them. Assuming the separation distance is constant, and they're not in wildly high inclination orbits, that would mean there's well over a hundred of the things."

"Acknowledged."

"Over a hundred," Ashly said. "That makes quite a civilization all told. How many Tyrathca do you think one of those diskcities could support?"

"With a surface area of twenty million square kilometres, I should think anything up to a hundred billion," Sarha said. "Even with their level of technology, that's a lot of area. Think how many people we cram into an arcology."

“Look at it from the population perspective, and no wonder the Anthi-CL dominion wanted exclusivity,” Liol said. “The demand on resources must be phenomenal. I’m astonished they managed to survive this long. By rights they should have drowned in their own waste products a long time ago.”

“Societies only have waste products while acquiring fresh raw material remains a cheaper option than recycling,” Samuel said. “This close to the star, the diskcities are extremely rich in energy. There can be few waste molecules that cannot be reprocessed into something useful.”

“Even so, they must have strong prohibitions on reproducing. I see a circle of life like this, and all I can think about is a culture growing in a dish.”

“That analogy doesn’t hold for sentient life. The Tyrathca nature is inclined to logically empowered restrictive behaviour. After all, they regulated themselves perfectly on a ten thousand year arkship voyage. This situation is no different for them.”

“Don’t assume their dominions are uniform,” Sarha said. “I’m detecting some areas on the disk with a much higher temperature than the others, their thermal regulation has completely broken down. Heat from the star is flowing straight through. They’re dead.”

“Maybe so,” Beaulieu said. “But there’s still a lot of activity down there. We’re being bombarded with radar signals from every section. A lot of dominions are very interested in us.”

“Still no ship launch,” Joshua said. “No one’s trying to intercept us before we reach Anthi-CL.” He accessed the sensors to watch Tojolt-HI growing against the radiant crimson expanse of the giant star. Apart from the scale involved, it was similar to their approach to the antimatter station. A jet-black, two-dimensional circle cutting right into the photosphere. The cold light of the nebula behind them was unable

to illuminate a single feature on the back of the diskcity. Only *Lady Mac*'s sensors could reveal the topography of mountainous towers pointing blindly away from the disk's median level. The flight computer's cartography program was having trouble compiling an accurate chart; the glare of electromagnetic emissions aimed at them was interfering with their radar return.

"What are they all saying?" he asked Oski.

"I'm running a keyword discrimination program on the datatrafic. From the samples so far, it's all pretty much the same. They all want us to dock at their own section of the diskcity, and each claims to have the greatest resources, as well as unique information."

"Any threats?"

"Not yet."

"Keep reviewing it."

Lady Mac flipped over and began decelerating.

Sensor data on Tojolt-HI built up slowly during the approach phase, giving the crews on *Lady Mac* and *Oenone* a good idea how the massive diskcity was constructed. The median sheet which formed the actual disk itself was an amalgamation of dense webs made up out of tubular structures, varying from twenty to three hundred metres in diameter. Though closely packed, they didn't touch except at end junctions; the gaps between them were sealed over with foil sheets, preventing any of the red giant's light from penetrating and diluting the umbra. Individual web patterns were principally circular, also varying enormously in size, and overlapping in contorted tangles. Spectrographic analysis found the constituent tubes were mostly metallic, with some silicon and carbon composites stretching across large areas; over five per cent were crystalline, radiating a wan phosphorescence out towards the nebula. There were regions, spread at random over the darkside, where the tangle of pipes swelled out into complex abstract knots several kilo-

metres wide. It was as if the tubes had been subjected to severe lateral buckling, though the radar image couldn't determine any fractures.

The dense shade of the darkside was inevitably dominated by the thermal transfer machinery. Radiator panels stacked in kilometre-high cones stood next to circular fan towers of faint-glowing fins, minarets of spiralling glass tubes with hot gases rushing through them competed for root space with encrustations of black pillars like a spiky crystal growth, whose sheer ends fluoresced coral pink. Their meandering ranks formed mountain ranges to rival anything thrown up by planetary geology, running for hundreds of kilometres along the webs. Straddling the valleys between them on long stilt-like gantries were giant industrial modules. Dark metal ovoids and trapezohedrons of machinery, their exterior surfaces a solid lacework of pipes and conduits, rising to a crown of heat-dissipation fins or panels (a direct ancestry could be traced to the machinery on Tanjuntic-RI). Although the diskcity had an overall uniformity bestowed by its basic web design, no region or structure was the same, technologies were as heterogeneous as shapes. The standardisation and compatibility synonymous with the Tyrathca had clearly broken down between the dominions millennia ago.

As they drew closer, more movement became visible across the darkside. Trains, made up from hundreds of tanker carriages and kilometres in length, slid slowly along the valleys and embankments between the thermal transfer systems. Their rails were an open framework of girders; suspended above the tubes and foil sheets of the disk, undulating like a roller coaster track, dipping down to merge with the larger tubes, allowing the trains to run inside them, then rising up the stilt legs of industrial modules to pass straight through the middle.

"Who the hell built this place?" Ashly asked in bemuse-

ment as the grey pixels built up into a comprehensive image in this neural nanonics. "Isombard Kingdom Brunel?"

"If it works, don't try and fix it," Joshua said.

"There is more to it than that," Samuel said. "Tojolt-HI is not a declining technology. They have selected the simplest engineering technology which can sustain them. Whilst humans would no doubt progress to developing a full Dyson sphere over fifteen thousand years, the Tyrathca have refined something that requires the minimum of effort to maintain. It does have a kind of elegance."

"But it still fails repeatedly," Beaulieu said. "There are dozens of dead sections across the disk. And each failure would cost them millions of lives. Any sentient creature should try to refine its living environment to something less prone to accident, surely?" Samuel shrugged.

The Anthi-CL dominion began issuing instructions for *Lady Mac's* final rendezvous coordinate. A blueprint they transmitted identified a specific section of the rim, which the flight computer matched up to the sensor image. The Anthi-CL dominion wanted them to keep station two kilometres out from a pier-like structure protruding from the edge.

"How is the translation program update coming on?" Joshua asked Oski. "Do we know enough to communicate directly now?"

"It's integrated all the new terms we've encountered so far; the analysis comparison subroutine response time is down to an acceptable level. I'd say it's okay to try and talk to them."

Lady Mac's drive thrust was reducing steadily as she drew level with the plane of the disk. In comparison to the desolate solidity of the darkside, the rim appeared to be unfinished. It bristled with slender spires and protruding gantry platforms wrapped in cables. Clumps of tanks and pods were attached to various open frame grids.

"At last," Sarha said. "That's got to be a ship."

The vessel was docked to the rim a hundred kilometres along from their rendezvous coordinate. It had a simple profile, a pentagon of five huge globes scintillating with a soft gold and scarlet iridescence under the gas-giant's illumination, each one at least two kilometres in diameter. They surrounded the throat of an elongated funnel made from a broad mesh of jet-black material; its open mouth was eight kilometres across. There was no recognizable life support section visible from *Lady Mac*'s current position.

"Picking up a lot of very complex magnetic fluctuations from that thing," Liol said. "Whatever it does, there's a lot of energy involved."

"If I didn't know better, I'd say it was a Bussard ram-scoop," Joshua said. "It was a neat idea, pre-ZTT era interstellar propulsion. Use a magnetic scoop to collect interstellar hydrogen, and feed it direct into a fusion drive. A cheap and easy way to travel between stars, you haven't got to worry about carrying any on-board fuel. Unfortunately it turns out the hydrogen density isn't high enough to make it work."

"In our part of the galaxy, maybe," Liol said. "What's the hydrogen density in space between a red giant and a nebula?"

"Good point. That could mean they're in contact with the closest colony stars." He didn't believe it; there was some missing factor here. What would be the reason to travel to a nearby star? You couldn't trade over interstellar distances, not with slower-than-light ships. And given your destination would have the same technology and society as your departure point, what could be traded anyway? Any differences or technological improvements that sprung up over the millennia could be shared by communication laser. "Hey," he exclaimed. "Parker?"

"Yes, Joshua?" the old director responded.

"We thought the reason for Tanjuntic-RI losing contact

with Mastrit-PJ was because civilization failed here. It hasn't. So why did they go off-air?"

"I have no idea. Perhaps one of the colony worlds relaying the messages round the nebula collapsed."

"A Tyrathca society failed? Isn't that a bit unlikely?"

"Or it was killed off," Monica said. "I'd like to think the enslaved xenocs finally rebelled and wiped them out."

"Possible." Joshua wasn't convinced. *I'm missing something obvious.*

Lady Mac fell through the plane of the disk. It was a deliberate overshoot, allowing them to see Tojolt-HI's sunside. Here, at last, they found the invariable conformity they'd grown to expect from the Tyrathca.

On this half of the disk, every tube section was made from glass; a trillion corrugations held together by black reinforcement hoops like the roof of God's greenhouse. Light evaporating from the photosphere below was thick enough to qualify as a crimson haze; it gusted against the diskcity, only to be rebuffed by the burnished surface in copper ripples longer than planetary crescents. This was a hint of how sunset over eternity's ocean would appear.

"Jesus," Joshua crooned. "I guess this makes up for Tanjuntic-RI."

They held position for several minutes with every sensor boom extended to gather in the scene, then Joshua reluctantly fired the secondary drive rockets to bring them back into the disk plane and back towards the rim. He locked *Lady Mac's* position in the coordinate Anthi-CL had given them, and initiated a barbecue roll. The starship's thermodump panels were spread out to their full extent, glimmering cherry red whenever they turned into shadow.

As soon as Sarha confirmed their on-board heat exchangers could handle the sun's heat, Joshua opened a direct communication channel to the Anthi-CL dominion.

"I would like to speak with Quantook-LOU," he said.

The reply came back almost immediately. "I speak."

"Again, I thank the Anthi-CL dominion for receiving us. We look forward to beginning a prosperous exchange, and hope that it will be the first of many between our respective species." Make them believe that others will be coming, he thought; that implies any forceful action on their part would ultimately have to be accounted for. Pretty unlikely given the scale of things around here, but they don't know that.

"We too have that anticipation," Quantook-LOU said. "That is an interesting ship you fly, Captain Calvert. We have not seen its like before. Those of us who disputed your claimed origin no longer do so. Is it a subsidiary vessel of your starship, or did you cross interstellar space in it?"

Joshua gave his brother a disconcerted look. "Even if this translation program is getting creative on me, they're not responding like any Tyrathca I know about."

"That's a leading question, too," Samuel cautioned. "If you confirm we travelled round the nebula in *Lady Macbeth* they'll know we have faster-than-light travel."

"And they'll want it," Beaulieu said. "If we're right about the pressure on local resources, it's their escape route out past the surrounding colony worlds."

"No it's not," Ashly said. "I lived through the Great Dispersal, remember. We couldn't even shift five per cent of Earth's population when we really needed to. ZTT isn't an escape route, not even with the industrial capacity of a diskcity. Everything is relative. They could build enough ships in a year to transport billions of breeder pairs away from Mastrit-PJ, but they'd still be left with thousands of billions living in the diskcities. All of whom would be busy laying more eggs."

"It might not solve their problem, but it would certainly give star systems where they propose to settle one hell of a headache," Liol said. "We've seen what they'll do to aboriginal species occupying real estate they want."

Joshua held up a hand. "I get the picture, thank you. Though I think we have to consider ZTT technology as our ultimate purchasing power to get the Sleeping God's location. The Hespero-LN Tyrathca already have ZTT. It might take decades to reach Mastrit-PJ, but it will spread here eventually."

"Try not to," Monica said forcefully. "Try very hard."

Joshua held her stare as he reopened the channel to Quantook-LOU. "The nature of our ship is one of the items of knowledge we can discuss as part of the exchange. Perhaps you would like to list the areas of science and technology you have the most interest in acquiring."

"What areas do you excel in?"

Joshua frowned. "Wrong," he mouthed to his crew. "This is not a Tyrathca."

"I agree, this is not a response I would expect from one," Samuel said.

"Then what?" Sarha asked.

"Let's find out," Joshua said. "Quantook-LOU, I think we should start slowly. As a gesture of good faith, I would like to give you a gift. We might then start to exchange our histories. Once we understand each other's background we should have a better idea where useful exchanges can be made. Are you agreeable to this?"

"In principle, yes. What is your gift?"

"An electronic processor. It is a standard work tool among humans; the design and composition may be of interest to you. If so, duplication would be a simple matter."

"I accept your gift."

"I will bring it to you. I am eager to see the inside of Tojolt-HI. It is an astonishing achievement."

"Thank you. Can you dock your starship to one of our ports? We do not have a suitable ship to collect you from your present position."

“Curiouser and curiouser,” Liol said. “They can build habitats the size of continents, but not commuter taxis.”

“We have a small shuttle craft we can use to reach the port,” Joshua said. “We will remain in spacesuits while we are inside Anthi-CL to avoid biological contamination.”

“Is a direct physical encounter between our species dangerous?”

“Not if adequate precautions are taken. Our species is very experienced in this field. Please don’t be alarmed.”

Joshua piloted the MSV himself, ignoring Ashly’s snide remarks about union rules. It was cramped in the little cabin; Samuel and Oski came with him, as well as a serjeant (just in case). He had to promise the others a rota for visiting the diskcity, everyone had wanted to come.

The port which Quantook-LOU had designated was a fat bulb of grey-white metal four hundred metres across, which flared out from the end of a web tube. Its apex was taken up by a circular hatch seventy-five metres in diameter, open to show a dimly-lit interior.

“Looks like one big empty chamber in there,” Joshua said. He fired the thrusters carefully, edging the little craft inside. Gentle red light shone from long strips that curved round the walls like fluorescent ribs. Between them were rows of almost-human machinery. It put him in mind of the docking craters in Tranquillity’s spaceport.

Directly opposite the main outer hatch was a stubby cylindrical grid, with much smaller airlock hatches at the far end. Joshua steered the MSV towards it.

“Your datavise carrier is starting to break up,” Sarha reported.

“That’s to be expected, though a good host would offer us a constant link. We’ll start to worry if they actually shut that hatch.”

The MSV reached the top of the cylindrical grid. Joshua

extended one of the vehicle's waldo arms to grip it in the clamp. "We're secure," he reported, using the band to Quantook-LOU.

"Please proceed to the airlock ahead of you. I await on the other side."

Joshua and the others fastened their space armour helmets into place. They assumed the Tyrathca didn't have programmable silicon, so they wouldn't know about SII suits. The armour would appear to be their actual spacesuit, reducing the risk of offending their hosts at the same time providing a degree of protection. The MSV's cabin atmosphere cycled and the four of them slid out.

There were three airlock hatches at the end of the grid. Only one of them, the largest, was open. The chamber behind was a sphere six metres across.

"Those other hatches were too small for the breeders," Samuel said. "I wonder if one of the vassal caste has been bred for a higher IQ; they certainly weren't capable of useful engineering work before."

Joshua didn't reply. He stuck his boots to what could have been the chamber floor just as the atmospheric gas started to hiss in. Suit sensors told him was a composition of oxygen, nitrogen, carbon dioxide, argon, and various hydrocarbon compounds, the humidity level was very high, and there were several classes of organic particulate in circulation. He made a strong effort to keep his hand away from the innocuous-looking cylinder on his belt which was actually a laser.

Strangely, he felt no excitement at this moment. It was almost as if there was too much riding on it for him to take anything other than an objective view. A good thing, he supposed.

The inner hatch opened, revealing one of Tojolt-HI's wider habitation tubes dwindling away to a flat metal bulkhead a kilometre away. Two colours dominated the interior: red and brown. Joshua smiled round his suit's respirator tube

as he saw the cluster of xenocs waiting for him. They weren't Tyrathca.

First impression was a shoal of human-size seahorses floating cautiously in the air. They had that same kind of flowing twitch along the length of their body, as if forever poised at the start of a race. Their colouring was almost black, though Joshua suspected that was due to the unvarying red light; sensor spectral analysis showed their scales were actually a shade of dark grey-brown very close to the Tyrathca, suggesting a common Mastrit-PJ ancestry. The head was pointed, dragon-like, with a long beak-mouth and two small semi-recessed eyes. It was held almost at a right angle to the body by a heavily wrinkled neck, suggesting considerable flexibility. The rest of the body had an ovoid cross section that gradually tapered away towards the base, though there was no sign of any tail. It curved slightly, producing an overall S-shape. Three pairs of limbs were spaced equidistantly along it, all sharing the same basic profile: a long first section extending away from a shoulder-analogue socket and ending in a wrist joint. The hand appendage was elongated with nine twin-knuckle digits. On the highest set of limbs they were thin and highly dextrous; the middle set were smaller and thicker; while the hindset were stumpy, toes rather than fingers. On most of the xenocs the hind feet appeared to be withered; becoming simple paddles of flesh, as though they were borrowed from aquatic creatures.

It was an appropriate classification. Every surface inside the tube sprouted lengthy ribbon fronds of rubbery vegetation, all of them reaching up for the geometric centre. Even those planted in the glass were growing directly away from the light, something Joshua had never seen on any terracompatible world he'd visited, no matter how bizarre some of its aboriginal botany and biochemistry.

The constant tangle of vegetation along the inside of the

tube did however make movement very easy for the xenocs. They seemed to glide along effortlessly through the topmost fringe, with the lower half of their bodies immersed in the brown fronds, their limbs wriggling gently to control their motion. It was a wonderfully graceful action resulting from what was essentially a mad combination of the smooth flick of a dolphin flipper and a human hand slapping at grab hoops.

Joshua admired it with mild envy, at the same time wondering just how long evolution would take to produce that kind of arrangement. It was almost a case of symbiosis, which meant the fronds of vegetation would have to be *very* prevalent.

He couldn't doubt these xenocs were intelligent beyond any Tyrathca vassal class the Confederation had encountered. They wore electronic systems like clothes. The upper half of their bodies were covered in a garment that combined a string vest with bandolier straps to which various modules were clipped, interspersed with tools and small canisters. They also went in for exoaugmentation; lenses jutted out of eye sockets, while plenty of them had replaced upper-limb hands with cybernetic claws.

Joshua switched his sensor focus around them until he found one whose electronics seemed slightly better quality than the others. Their styling was more slimline, with elegant key pads and displays. Some of the modules were actually embossed with marmoreal patterns. A fast spectrographic scan said the metal was iron. Curious choice, he thought.

"I am Captain Joshua Calvert, and I apologize to Quantook-LOU," he said. The communication block relayed his words into the hooting whistles of Tyrathca-style speech, which he could just make out through the muffling of the SII suit's silicon. "We assumed the Tyrathca occupied this place."

The creature his sensors were focused on opened its

gnarled beak and chittered loudly. "Do you wish to leave now you have found it is otherwise?"

"Not at all. We are delighted to have gained the knowledge of your existence. Could you tell me what you call yourselves?"

"My race is the Mosdva. For all of Tyrathca history we were their subjects. Their history has ended. Mastrit-PJ is our star now."

"Way to go," Monica said over the general communication band.

"Let's not jump to conclusions," Syrinx admonished. "They're clearly from the same evolutionary chain."

"Relevant observations only," Joshua told them. "I mean, do we even need to carry on? We can be diplomatic here for a couple of hours, then fly off to the nearest probable Tyrathca colony star to get what we need."

"They have the same language and origin planet," Parker said. "It's highly probable they share the same stellar almanac. We need to know a lot more before we even consider moving on."

"Okay." Joshua datavised his communication block back to its translation function. "You have achieved much here. My race has never built any structure on such a scale as Tojolt-HI."

"But you have built a most interesting ship."

"Thank you." He took a processor block from his belt slowly and carefully. It was one that he'd found in *Lady Mac's* engineering workshop, a quarter of a century out of date and loaded with obsolete maintenance programs (they'd erased any reference to starflight). The general management routine might be of some interest to the xenocs, especially from what he could see of their own electronics. In fact, it might be a slightly too generous gift; half of their modules would have been archaic back in the Twenty-third Century. "For you," he told Quantook-LOU.

One of the other Mosdva slithered forwards through the foliage and gingerly took the block before hurrying back to Quantook-LOU. The distributor of resources examined it before putting it in a pouch near the bottom of his torso garment.

“I thank you, Captain Joshua Calvert. In return, I would show you this section of Anthi-CL, of which you have expressed such interest.”

“Was that cynicism?” Joshua asked his people.

“I don’t think so,” Oski said. “The Tyrathca language as we know it doesn’t have the carrier mechanism for that kind of nuance. It can’t, because they don’t have cynicism.”

“Might be a good idea to keep the analysis program watching for those kind of patterns emerging.”

“I’ll second that,” Samuel said. “They’ve been bombarding us with sensor probes from the second that hatch opened. They’re clearly looking for an advantage. This kind of mercantile behaviour is thankfully easy to appreciate. It almost makes them human.”

“Wonderful. Sixteen thousand light years, and all we get to meet is the local equivalent of the Kulu Traders Association.”

“Joshua, your first priority is to understand exactly what position Quantook-LOU has within their social structure,” Parker said. “Once that is known, we’ll be able to proceed quickly to a resolution. Their culture is plainly developed along different lines from the Tyrathca, though I’m happy to say the basics of trade apparently remain a fundamental.”

“Yes, thank you, Mr Director.” And I wonder if *he* understands cynicism. “I would be honoured to see your dominion,” Joshua told the Mosdva.

“Accompany us, then. I will enlighten you.”

The whole Mosdva group turned, virtually in unison, and began their sliding glide along the vegetation. Joshua, who considered himself highly proficient in freefall conditions,

was fascinated by the manoeuvre. There was a lot of torque and inertia involved with such a move; their mid-limbs must apply a lot of pressure to the fronds. And the fronds themselves must be stronger than they looked; try tugging a terrestrial palm like that and you'd rip it in half.

He cancelled the tak pad application on his boot soles and kicked off after them. Ultimately, he cheated, using the cold gas jets of his armour's manoeuvring pack as well as climbing a frond like a rope. When he reached the upper fringes, the fronds now did their best to impede his progress; where they parted for any Mosdva, they formed elastic nets for him. The best method, he found, was to stay above their tips altogether, and reach down as necessary to swing yourself along. Gauntlet tactile sensors reported the vegetation was spongy, but with a solid spine.

Out of the four of them, he was the most agile, though he struggled to keep up with Quantook-LOU. And the serjeant's motions were plain painful to watch; Ione had not ventured into Tranquillity's zero-gee sections very often.

The Mosdva had slowed to observe the progress of the humans, allowing them to catch up.

"You do not fly as fast as your ship, Captain Joshua Calvert," Quantook-LOU said.

"Our species lives on planets. We're accustomed to high-gravity environments."

"We know of planets. The Mosdva have many stories of Mastrit-PJ's worlds before the expansion devoured them all. But there are no pictures on file in Tojolt-HI, not after such a time. They are as legend, now."

"I have many pictures of planets in my ship. I would welcome exchanging them for any pictures you do have of Mastrit-PJ's history."

"A good first exchange. We are fortunate to have made contact with you, Captain Joshua Calvert."

Joshua had been hanging on to a frond tip as he waited for

the serjeant to catch up; now he realized the plant was wriggling slightly. There certainly wasn't enough of a breeze to do that.

"The fronds stir the air for us," Quantook-LOU explained when he mentioned it. All plants on Tojolt-HI flexed gently; that was why they'd originally been selected, and careful breeding had enhanced the trait. Air had to be moved in freefall, or stagnant pockets of gas would build up, unpleasant and potentially lethal for animals and plants alike. The Mosdva still had mechanical fans and ducts, but they were very much secondary systems.

"Not quite up to Edenist levels," Sarha said.

"They're edging towards biological solutions," Ruben replied. "Leaving the mechanical behind."

"You can't use wholly biological systems here, not in this environment, it's too hostile."

"And there is precious little sign of genetic engineering techniques being employed," Samuel said. "Quantook-LOU told us the plants were bred. Cross-pollination is almost a lost art in human society, Adamist and Edenist alike. We shall have to be more careful here than we originally expected, both in what we say and what we exchange with them. This society is static, and it survives perfectly by being so. To introduce change, even in the form of concepts, could be disastrous to it."

"Or save it," Sarha said.

"From what? We are the only conceivable threat it faces."

They progressed further along the tube, gradually encountering more Mosdva as they went. All of the xenocs stopped to watch as the humans went past, slow and clumsy in comparison to their entourage. Mosdva children flashed about through the fronds, incredibly agile. They burrowed deep below the tips in smooth dives and popped out everywhere, making sure they got a look at the humans from all angles. Like the adults, they wore torso harnesses that con-

tained a multitude of electronic modules—but none of them had cybernetic implants.

Looking down past his gauntlets, Joshua could see straight through the corkscrew fronds. They weren't as dense as he'd first thought—a plantation rather than a jungle—which allowed him to piece together how the tube was constructed. There was an outer casing, the ribbed section with glass on the sunside, and an opaque composite or metal on the darkside. Lining that on the inside was a tightly packed spiral of transparent piping, studded with small copper-coloured annular apertures from which the plants grew. Their roots were visible inside the pipe, just. The spiral was filled with an opaque and somewhat glutinous fluid which cut down the sun's intense red glare. It was also flecked with dark granules and a swirl of tiny bubbles, which showed him how fast it was being pumped along.

The spirals contained either water or hydrocarbon compounds, Quantook-LOU said when Joshua asked what it was; its circulation formed the basis for their whole recycling philosophy. Heat from the red giant was swiftly carried round to the darkside, where it was disposed of via the thermal exchange mechanisms, generating electricity in the process. A range of algal species flourished inside the various fluid types, absorbing Mosdva faecal waste and transforming it into nutrients for the plants, which in turn maintained the atmosphere. The thickness of the spiral pipe (none under two and a half metres in diameter) meant the fluid bulk also acted as an excellent protection from stellar radiation.

They were shown web tubes which specialised in high-yield arable plants. Living tubes, which were sectioned off by thin sheets of silvery-white fabric. Industrial tubes, whose manufacturing machinery was strung out along the axis, just above the plant tips. (“Condensation must be hell

for them," Oski said at that.) Huge public tubes thronging with Mosdva.

After two hours, they were in a section dedicated to what the translator program termed the Anthi-CL dominion's *administrative class*. Joshua began to suspect a society structured along strictly aristocratic hierarchy lines. The vegetation was lusher here, the technology less obtrusive. Personal tubes radiated away from the main branches, far more substantial than the living sections they'd seen earlier and with a lower population density. Two thirds of their entourage dropped away once they entered. Those that were left were heavily augmented with cybernetic prosthetics. No overt weapons, but the humans agreed they were police/military.

Quantook-LOU stopped in a large bubble of transparent material, the junction for three small tubes. The surface was still a spiral of pipe dotted with chunks of hardware, but there were no plants; and apart from the bubbles, the fluid was almost clear. It gave a peerless view out over both dark-side and sunside.

"My personal space," Quantook-LOU said.

Joshua could just make out the misty smears of the nebula through the curving walls. Sharp-edged dissipater cones formed a strange, close horizon. Sunside was a simple uniform mantle of red light. "It is matched with everything else we have seen here," he said.

"What of your world, Captain Joshua Calvert? Does it have sights to match this?"

The exchange of history began. Under the Mosdva's urging, Joshua, Samuel, and Oski started off describing continents and oceans (concepts which had to be clearly defined for the Mosdva—they'd even lost the words for them in their language), and moved on to explain how humans had emerged from Africa to spread across Earth after the Ice Age glaciers retreated. How a technoindustrial society had devel-

oped. The rampant pollution which had altered the planetary ecology for the worse, creating an era where ships flew between the stars to found new colonies. How the Confederation now embraced hundreds of star systems, and traders prospered among them. A colourful generalised summary, devoid of any real detail and timescale.

In return, the Mosdva told them of Mastrit-PJ's long story; how neither they nor the Tyrathca were the original sentient species on the one planet which supported biological life. The Ridbat were the first, with a society that had flourished over a million years ago. Little was known of them now, Quantook-LOU said, other than whispers that trickled from generation to generation becoming wilder with each telling. They were Mastrit-PJ's true monsters, ravenous beasts with evil minds. Wars had been constant while they were alive, two of which escalated into the exchange of nuclear weapons on the planetary surface. Their civilization was knocked back from an advanced technological culture to primitive barbarian on at least three separate occasions. It wasn't known if they ever had spaceflight; there was no evidence of off-planet activity. The fourth and last Ridbat industrial era was brought to an end by thermonuclear conflict, concurrent with the release of biological weapons which wiped them out along with seventy per cent of the planet's animal life.

The Mosdva had risen to a rudimentary state of intelligence while the Ridbat ruled the planet. That made them useful slave creatures, who were bred for dexterity and strength and passivity while any traits such as curiosity or stubbornness were ruthlessly culled. By the time the Ridbat exterminated themselves, the Mosdva had become fully sentient. Although their population was severely reduced by the diseases raging across the land, they did at least survive as a species.

With the Ridbat gone, Mosdva evolution reverted to more

traditional lines—as normal as life could become on such a ruined planet. Their own civilization was extremely slow to emerge as a coherent whole. Mastrit-PJ, with its exhausted mineral resources, devastated biosphere, and extensive radioactive deadlands, was not an environment conducive to sophisticated or high-technology-based cultures, and the cautious Mosdva psychology fitted this well. They became nomadic during the period of nuclear winter which followed the demise of the Ridbat, roaming between habitable areas. It was only after the glaciers withdrew, half a million years later, that the Mosdva began to advance again.

They achieved a modest level of industrialisation. Because there were no underground petrochemical deposits left, nor coal or natural gas, their technology was based around the concept of sustainability, benign and in harmony with the ecosystem. Although not opposed to change, change generated from within was extremely slow to manifest itself. Steady advances in the theoretical fields of science such as physics, astronomy and mathematics were not grasped upon for technological extrapolation. They already lived in what they considered to be a golden age. After their terrible heritage, stability was the one icon they craved above all else. Such a desire could have led to a society whose timescale rivalled geological epochs.

Fate dealt that prospect two bitter blows. Once the glaciers were gone, the Tyrathca, until then simple bovine herd animals, began to share in Mastrit-PJ's evolutionary renaissance. Their sentience was a long time emerging, but their progress towards it reflected their physical stamina, plodding forwards imperturbably. On any other world, their total lack of imagination would have been a serious flaw, but not here. Sharing the planet with a species as benevolent and (by now) advanced as the Mosdva meant that they had access to machinery and concepts they themselves could never originate.

Unfortunately for the Mosdva, the Tyrathca were more aggressive, a trait which came from their herd ancestry and its consequent territorial disputes, which in turn led to the breeding of the vassal castes, especially the soldiers. With their copied technology, greater size and larger numbers, they swiftly became the dominant of the two species.

This situation could well have spelt extinction for the Mosdva. Their settlements were being put under considerable pressure by the Tyrathca expansion. Then Mosdva astronomers discovered their star was about to expand into a red giant.

For a race whose thoughts operated on an abstract level, the knowledge of certain extinction in 1,300 years' time would be devastating enough; for the Tyrathca, to whom a fact was immediate, it was intolerable. Racial survival provided a unifying motivator which enabled them to swiftly consolidate their domination of the planet. For the second time in their existence, the Mosdva were effectively enslaved. First they were used to devise a scheme whereby some if not all the Tyrathca could survive the star's expansion. They came up with the arkship concept which would guarantee ultimate racial survival, with habitable asteroids sheltering the remainder of the population which couldn't be evacuated. Secondly, they were made to implement it.

With their smaller bodies, greater dexterity, and higher intelligence, they made excellent astronauts—unlike the Tyrathca themselves. Mosdva technical expertise was adapted and utilized to capture asteroids and shunt them into orbit around Mastrit-PJ, where they were hollowed out and converted into arkships. The arkship building phase lasted for seven centuries, in which time 1,037 were built and launched.

After this, with the star's growing instability wrecking the planet's fragile ecology, Mastrit-PJ's massive space manufacturing capability was switched to adapting asteroids into

habitats. The asteroids chosen were orbiting more than a quarter of a billion kilometres from the star, putting them outside the predicted expansion photosphere. As this operation was far simpler than changing asteroids into giant starships, over seven thousand were created in just two centuries. Unlike the arkships which were immediately lost to the Tyrathca upon completion, building the asteroid habitats was a near exponential growth process, as new habitats used their industrial capacity to prepare further asteroids.

A thousand years after the project began, the planet had become uninhabitable, and was completely abandoned.

No Mosdva were ever carried on an arkship, the vessels were used exclusively by the Tyrathca. As soon as they had finished building one, the Mosdva were moved on to the next.

However, they couldn't be excluded from the asteroid habitats without a policy of complete genocide. The Tyrathca tolerated them, knowing that their own numbers were constantly rising, necessitating an ongoing construction programme. And with the exact conditions of the star's expansion unknowable, they would need Mosdva technical ability to adapt the asteroid habitats to the environment of the swollen photosphere.

When Mastrit-PJ's star expanded, its diameter was larger than predicted, as was its radiant heat output. New, larger thermal dissipation systems had to be constructed for the asteroid habitats, and quickly. As a consequence, the habitats became even more engineering-dependent, which began the gradual shift of political power. Only Tyrathca breeders were capable of any meaningful technological activity, making all but the builder, housekeeper, and farmer vassal castes redundant. Their soldier caste was now bred purely to keep the Mosdva in line.

The revolution didn't happen all at once, but rather over a thousand year period, starting ten thousand years earlier.

The asteroid habitats initially formed a cohesive one-nation grouping after the expansion. But the scarcity of mass in the form of unused asteroids to mine forced the Tyrathca to revert to their original clannish state of competition. As the number of unused asteroids declined, wars were fought over the remainder. Each asteroid habitat reverted to complete autonomy.

After that, the rise of the Mosdva to supremacy was inevitable. They controlled the habitat machinery, and industrial facilities, a power they discovered which enabled them to dictate their terms to the Tyrathca.

Under this new order, the asteroid habitats gradually banded together politically and physically. As they did, new design concepts were enacted, bringing the old Mosdva dictum of sustainability to the fore, enabling them to maximise their use of dwindling mass resources. Life support sections outside the spun-gravity biospheres were constructed. First they were little more than adjuncts to the gridwork which held the clustered asteroid habitats together; transport and transfer tubes, eliminating the wasteful need for airlocks and vessels. But the Mosdva, with their climbing-adept limb arrangement and natural agility, found they adapted well to the freefall environment inside them. Only the Tyrathca needed gravity and the associated complex engineering to maintain the rotating biospheres. More freefall segments were constructed and added to the clusters, hydroponics and industrial sections first; which led to their technicians spending more and more time in freefall. Living sections followed quickly. The era of the diskcities began.

“And the Tyrathca?” Joshua asked. “Are they still here?”

“We do not keep them any more,” Quantook-LOU said. “They are no longer our masters.”

“I congratulate you on ridding yourselves of them. The Confederation has always found them difficult to deal with.”

“But we are not difficult, I hope. And the dominion of

Anthi-CL is on the edge of Tojolt-HI. That makes us rich in mass, more than any other. We are good trading partners for you, Captain Joshua Calvert.”

“How does being on the edge of Tojolt-HI make you richer than other dominions?”

“Is that not obvious? All ships have to dock at the edge. All mass flows through us.”

“Oh, classic,” Ruben said. “The rim dominions are the diskcity harbourmasters, they can charge what they like to allow cargo through. They’ve probably got some kind of political alliance between themselves to put the squeeze on the central dominions.”

“A minimum fee?” Joshua asked.

“Most likely. It puts us in a good position. Everything travels through them; QED, they must have good communications with all the other dominions. They should be able to find us a copy of the almanac file if it still exists.”

“Okay.” Joshua checked his neural nanonics time function. They’d been in the diskcity for nine hours. “I thank you for your hospitality, Quantook-LOU. My crew and I would like to return to our ship now. We have gathered enough information to see where our respective interests lie, so we’ll start reviewing what items and information we’ve brought with us which will bring about the most beneficial exchange for both of us.”

“As you wish. How long will this review process take?”

“Only a few hours. I look forward to returning, and the start of true negotiations between us.”

“As do I. Our resources will be marshalled to cope with your demands. Perhaps then I could visit your ship?”

“You would be an honoured guest, Quantook-LOU.”

Ten Mosdva formed the entourage to see them back to the MSV. It had been left untouched, though Ashly and Sarha who’d been monitoring its status, reported it had been bombarded by every conceivable active sensor sweep.

As soon as they were back through *Lady Mac*'s decontam procedure, Joshua ordered the SII suit to withdraw, giving a huge sigh as his skin was exposed to air again. "Jesus, I thought that Quantook character would go on forever about how wonderful his people are. Don't they ever sleep?"

"Probably not," Parker said. "As a general rule, sleep evolves from a planetary day-night cycle; they don't have that here any more. I suspect they have slow periods, but no actual sleep."

"Ah well, that's one weakness we'll have to concede to them. I need a meal, a gel wipe, and some time in the cocoon. It's been a long day."

"I concur," Syrinx said. "The ELINT satellites are approaching operational range, which may or may not give us useful information on the dominions. We also need to evaluate what we've heard today, and I'd like us all fresh for that. We'll reconvene in six hours to see what the satellites have found and discuss the next stage."

Joshua managed three hours in the cocoon before he woke. He stared at the cabin wall for fifteen minutes before acknowledging he'd need to put a somnolence program into primary if he wanted to sleep again. He hated doing that.

Liol, Monica, Alkad, and Dahybi were already in the small galley when he air-swam through the hatch. They gave him varying sympathetic looks which he acknowledged ruefully.

"We've been talking to Syrinx and Cacus," Monica said. She shrugged at Joshua; he'd paused in the act of filling his tea sachet from the water nozzle to raise an eyebrow. "Not just us that's restless. Anyway, they've located another seven diskcities."

Joshua datavised the flight computer for a general communication link and said good morning to the *Oenone*'s crew.

"The Mosdva empire appears to be quite extensive," Sy-

rinx told him. "Judging by the distribution of diskcities we've seen so far, that early estimate needs to be revised upwards. Fair enough if we believe there were seven thousand asteroid habitats to begin with. Kempster and Renato have also been scanning further out from the photosphere. So far they haven't located a single lump of rock within twenty degrees of the ecliptic. Quantook-LOU was telling the truth when he said there was a desperate struggle for mass after the stellar expansion. Every spare gram must have been incorporated into the diskcities."

"Quantook-LOU didn't say struggle," Joshua said. "He said wars, plural."

"Which he blamed squarely on the Tyrathca," Alkad said.

Joshua gave the physicist a bleak look. She didn't say much, but her comments were normally pretty valid. "You think the Mosdva took control earlier than that?"

"We can never know exactly what this star system's history is, but I would think it likely that the Mosdva started their revolt right after the star's expansion phase. That would be when the Tyrathca were most dependant on them. Everything else we've been told does tend to paint them in an unusually generous light. An oppressed people struggle to regain their long-lost freedom. Please. History is always written by the good guys."

"I did gloss over some of our less endearing traits," Joshua said. "That's human nature."

"You should have stung Quantook-LOU's office space with some nanonic bugs," Liol said. "I'd love to hear what's being said in there right now."

"Too big a risk," Monica said. "If they found them, at worst they could interpret it as a hostile act; and even if they were diplomatic about it, we would have handed them a whole new technology."

"I don't think that leaves us much to worry about," Liol

said. "The Confederation isn't about to be invaded by Mosdva, it's the Tyrathca we have to worry about."

"Enough," Joshua said. He shifted round to make room for a sleepy unshaven Ashly who was drifting into the galley. "Look, we've just about got everyone up now anyway, we'd best convene and thrash out what we're going to do next."

There was one more discovery before the meeting started. Joshua was finishing his breakfast when Beaulieu datavised a curt message requesting him to access *Lady Mac's* sensor suite. "I've located a Mosdva ship," the cosmonik said.

"At last," Liol said eagerly. He closed his eyes and accessed the image.

Beaulieu hadn't activated any visual enhancement programs to counter the redness. All Joshua could make out was a big brilliant-white shape gliding up towards a rendezvous with Tojolt-II—the same configuration as the ship already docked to the rim: five huge globes clumped round a drive unit and scoop. Except these globes were glowing a vivid purple-white, brighter than the photosphere.

"It surfaced twenty minutes ago," Beaulieu datavised.

The cosmonik replayed the recording. *Lady Mac's* sensors had detected a magnetic anomaly within the photosphere, hundreds of kilometres wide, the flux lines twisting into a dense wood-knot pattern. But it was moving faster than orbital velocity, and growing larger. Visual sensors started tracking it, showing the endless scarlet haze. At first it was as unruffled as a sea mist at dawn, then the impossible happened and long streaks of shadow rippled across the picture. They were actually folds in the gas. Something underneath was stirring the igneous hydrogen atoms, creating swirling currents in the calm envelope. A bright patch of white light started to shine up through the red plasma. The ship rose up smooth and clean through the outer layers of the photosphere, scoop first, pushing a vast bow wave of glow-

ing ions ahead of it. Each of its five globes was shining as bright as a white dwarf star, radiating away enormous quantities of electromagnetic and thermal energy. Thick scarlet coronas avalanched from the lip of the scoop, purling gently all the way back down into the body of the red giant. The remainder of the nimbus was sucked down into the ship's funnel, growing steadily brighter as it progressed, until it was consumed by a dazzling white flame burning brightly at the throat.

"The globes have been dimming since it surfaced," Beaulieu said. "Their external temperature is dropping in concert."

"Looks like you were right about it being a ramscoop, Josh," Liol said cheerfully. "It's got to be where they get their mass from now the asteroids have been consumed. Fancy that, mining the sun."

"That thermal dump technology is damn impressive," Sarha said. "It's got to be superior to anything we have. Shedding heat while you're *inside* a star. God!"

"Simply compressing and condensing photosphere hydrogen into a stable gaseous state wouldn't generate that much heat," Alkad said. "They must be fusing it, burning it down into helium, perhaps even all the way to carbon."

"Christ, they must be desperate for mass."

"The iron limit," Joshua mused. "You can't fuse atoms past iron without having to input energy. Every other reaction until that element generates energy."

"Is that relevant?" Liol asked.

"Not sure. But it makes iron their gold equivalent. It can't hurt knowing what they value most. It's the trans-iron elements that they'll be running out of."

"The fact that they've resorted to this extraordinary method gives us some considerable leverage," Samuel said. "We've seen little evidence of molecular engineering compounds in the diskcity structure. Our materials science will

allow them to exploit mass far more efficiently than they do currently. Every innovation we bring has the potential for inflicting vast change upon them.”

“This is what we have to decide,” Syrinx said. “Liol, have the ELINT satellites revealed anything that might help us?”

“Not really. They’re holding station a thousand kilometres above the darkside now, which gives us excellent coverage. It’s pretty much what we observed as we flew in: trains moving about and very little else. Oh, we picked up a couple of nasty-looking atmospheric vents. The tubes must have ruptured. There were bodies in the gas stream.”

“They must fight a constant maintenance battle against structural fatigue,” Oxley said. “That’s a lot of surface area to cover.”

“Everything’s relative,” Sarha said. “There’s a lot of Mosdva to cover it.”

“I wonder how inter-dependant the dominions are,” Parker said. “For all Quantook-LOU says about driving a hard bargain on the cargo and mass which Anthi-CL sends to the inner dominions, they have to ensure supplies are preserved. Without fresh material, the tubes would decay. The inner dominions would react strongly to such a threat, I imagine.”

“We’ve confirmed eighty dead areas across Tojolt-HI,” Beaulieu said. “They amount to just under thirteen per cent of the total.”

“So much? That would tend to indicate a society in decline, possibly even a decadent one.”

“Individual dominions might fall,” Ruben said. “But overall their society remains intact. Face it, the Confederation has inhabited worlds that don’t exactly thrive, yet some of our cultures are positively vibrant. And I find it significant that none of the rim sections are dead.”

“The other major source of external activity is based around those dead sections,” Liol said. “It looks like major repair and reconstruction work. Those dominions certainly

aren't decadent, they're busy expanding into their old neighbours' territory."

"I can accept they're socially comparable to us," Syrinx said. "So based on that assumption, do we offer them ZTT technology?"

"In exchange for a ten-thousand-year-old almanac?" Joshua said. "You've got to be kidding. Quantook-LOU is smart, he'll know there's something very wrong about that. I'd suggest we build in an exchange of astronomical data and records along with whatever commercial trade deal we can put together. After all, they've never seen what lies on the other side of the nebula. If we offer them the ability to break free of Tyrathca-dominated space they'll need to know what's out there."

"I've told you," Ashly said. "ZTT isn't a way out."

"Not for the proles," Liol said. "But the leadership might take it for their families, or clans, or members of whatever cause they rally round. And it's the leadership we have to deal with."

"Is that the kind of legacy we really want to leave behind us?" Peter Adul asked quietly. "The opportunity for interstellar conflict and internal strife?"

"Don't get all moral on me," Liol said. "Not you. We can't afford those kind of ethics. It's *our* goddamn species on the brink here. I'm prepared to do whatever it takes."

"If, as intended, we're going to ask a God for its help, perhaps you should consider how worthy we're going to appear before it should you follow that course."

"What if it considers obliterating your foes to be a worthy act? You're assigning it very human traits. The Tyrathca never did that."

"That's a point," Dahybi said. "Now we know why the Tyrathca managed to get where they are with zero imagination, how does that reflect on our analysis of the Sleeping God?"

"Very little, I'm afraid," Kempster said. "From what

we've learned about them, I'd say that unless the Sleeping God explained itself to the Tyrathca of Swantic-LI, they simply wouldn't know what the hell it was. By calling it a God, they were being as truthful as only they can be. The simplest translation equates to our own: something so powerful we do not comprehend it."

"Just how much will ZTT change the diskcity society?" Syrinx asked.

"Considerably," Parker said. "As Samuel points out, just by being here we have changed it. We have shown Tojolt-HI that it is possible to circumvent Tyrathca space. As this is a species with an intellect not dissimilar to our own, we must assume they will ultimately pursue that method. In effect, that gives us control over the timing, nothing more. And allowing them access to ZTT now may generate a portion of goodwill among at least one faction of a very long lived and versatile race. I say we should pursue every effort to make the Mosdva our friends. After all, we now know that ZTT or the voidhawk distortion field ability are hardly the last word in interstellar travel, the Kiint teleport ability has taught us that lesson."

"Any other options?" Syrinx asked.

"As I see it, we have four in total," Samuel said. "We can try and get the almanac through a trade exchange. We can use force." He paused to smile apologetically as his fellow Edenists registered their disapproval. "I'm sorry," he said. "But we have that ability, therefore it should be examined. Our weaponry is likely to be superior, and our electronic and software capability would definitely be able to extract information from their memory cores."

"That's an absolute last resort," Syrinx said.

"Totally," Joshua agreed firmly. "This is a culture which wages war over any spare mass on a scale we've never seen before. They might not have sophisticated weapons compared to ours, but they'll have one hell of a lot of them; and *Lady Mac* is in the front line. What are the other two?"

“If Quantook-LOU proves uncooperative, we simply find a dominion which will help us. We’re not exactly short of choice. The last option is a variant of that: we leave straight away and find a Tyrathca colony.”

“We’ve established a reasonable level of contact with Quantook-LOU and the Anthi-CL dominion,” Sarha said. “I think we should build on that. Don’t forget time is a factor as well, and we came here so we wouldn’t have to deal with the Tyrathca.”

“Very well,” Syrinx said. “We’ll follow Joshua’s tactic for now. Set up a major commercial trade, and tack on the almanac data as a subsidiary deal.”

Joshua kept the same team with him when he returned to the diskcity. This time they were shown directly to Quantook-LOU’s private glass bubble.

“Have you found trade items within your ship, Captain Joshua Calvert?” the Mosdva asked.

“I believe so,” Joshua said. He glanced round the translucent chamber with its barnacles of alien machinery, vaguely disquieted. Something had changed. His neural nanonics ran a comparison check with his visual memory file. “I’m not sure if it’s relevant,” he told his crew through the affinity link, “But several chunks of hardware bolted onto the piping are different now.”

“We see them, Josh,” Liol answered.

“Anybody got any ideas what they could be?”

“I’m not picking up any sensor emissions,” Oski said. “But they’ve got strong magnetic fields, definitely active electronics inside.”

“Beam weapons?”

“I’m not sure. I can’t see anything that equates to a nozzle on any of them, and the magnetic field doesn’t correspond to a power cell. My best guess is that they’ve rebuilt this whole chamber as a magnetic resonance scanner: if they’ve got

quantum interface detectors sensitive enough they probably think it will allow them to look inside our armour.”

“Will it?”

“No. Our suit shielding will block that. Nice try though.”

“Did you examine the processor I gave you?” Joshua asked Quantook-LOU.

“It has been tested. Your design is a radical one. We believe we can duplicate it.”

“I can offer more advanced processors than that. As well, we have power storage cells that operate at very high density levels. We offer the formula for superstrength molecular chains; which should be very useful to you, given your shortage of mass.”

“Interesting. And what would you like in return?”

“We saw your ship returning from the sun. Your thermal dissipation technology would be extremely useful to us.”

The negotiation took off well, Joshua and Quantook-LOU reeling out lists of technology and fabrication methods. The trick was in trying to balance them: was optical memory crystal worth more or less than a membrane layer that could guard metal surfaces against vacuum ablation? Did a low-energy carbon filtration process have parity with ultrastrong magnets?

As they talked, Oski kept monitoring the new hardware modules. The magnetic fields they put out were constantly changing, sweeping across the translucent bubble in waves. None of them were able to penetrate their suits. In return, her own sensors could pick up the resonance patterns they generated inside the Mosdva. She slowly built up a three-dimensional image of their internal structure, the triangular plates of bone and mysterious organs. It was an enjoyable irony, she felt. After forty minutes, the magnetic fields were abruptly switched off.

Liol was paying scant attention to the negotiations. He and Beaulieu were occupied reviewing the data coming in from

their ELINT satellites. Now they had the observation subroutines customized properly, there was a lot of activity to see on the darkside. Trains moved everywhere, following a simple generalized pattern. Large full tankers made their way inwards from the rim, offloading cargo at the industrial modules, then once they were empty, they turned and went directly back to the rim. Goods trains, those loaded with items produced inside industrial modules, ran in every direction. Liol and Beaulieu were beginning to think they might even be independent trading caravans, forever touring round the dominions. Something Joshua hadn't asked was if the Mosdva had currency, or if everything was bartered.

"Another vent," Beaulieu commented. "It's only seventy kilometres from the captain's location."

"Christ, that's the third this morning." Liol ordered the closest satellite to focus on the plume. Bobbles of liquid were oscillating amid the gas squirting out towards the nebula. Ebony shapes, radiating brightly in the infrared, thrashed around inside it, their motions grinding down the further away they got from the darkside. "You'd think they'd have better structural integrity after all this time. Everything else they do seems to work pretty well. I know I wouldn't like to live with that kind of threat looming over me, it's worse than building a house on the side of a volcano." His subconscious wouldn't leave the notion alone; there was something wrong about the frequency of the tube breeches. He ran a quick projection through his neural nanonics. "Uh, guys, if they suffer structural failure at this rate, the whole diskcity will fail inside of seven years. And I've included some pretty generous rebuilding allowances in that."

"Then you must have got it wrong," Kempster said.

"Either that, or this isn't a normal event we're witnessing."

"Venting again," Beaulieu called out. "Same web as the last, barely a hundred metres apart."

In the *Oenone's* bridge, Syrinx gave Ruben an alarmed look. "Access all the visual records from the ELINT satellites," she said. "See what kind of activity there is in the vent areas prior to the actual event."

Ruben, Oxley, and Serina nodded in unison. Their minds merged with the bitek memory processors governing the satellites.

"Do we tell Joshua?" Ashly asked.

"Not yet," Syrinx said. "I don't want him alarmed. Let's see if we can confirm the cause first."

An hour after they began negotiating, Joshua and Quantook-LOU had finalized a list of twenty items to exchange. It was to be mainly information, formatted to the digital standard used by the Mosdva, with one physical sample of each item to prove the concept wasn't merely a boastful lie.

"I'd like to move on to pure data now," Joshua said. "We're interested in as much of your history as you're prepared to release; astronomical observations, particularly those dealing with the sun's expansion; any significant cultural works; mathematics; the biochemical structure of your plant life. More if you're willing."

"Is this why you have come?" Quantook-LOU asked.

"I don't understand."

"You have ventured around the nebula, sixteen thousand light-years by your own telling. You believed the Tyrathca were all that lived here. You say you came purely to trade, which I do not believe. There can be no meaningful trade between us, the distance is too great. At most it would take two or three visits by ships such as yours to level all differences between us. Your technology is so superior we cannot even scan through your spacesuits to verify you are what you say you are; which means that any machinery you see here you will be able to understand and duplicate without our assistance. In effect, you are giving us a multitude of gifts. Yet you are not driven by altruism, you pretend you are

here to trade. You persevere in the task of gaining information from us. Therefore, we ask, what is your true reason for coming to this star?"

"Oh Jesus," Joshua moaned over their secure communication link. "I'm not half as smart as I thought I was."

"None of us are, it would seem," Syrinx said. "Damn, he saw right though our strategy."

"In itself a useful piece of information," Ruben said.

"How so?"

"Everything in Anthi-CL is valued in terms of resources. Quantook-LOU controls their distribution, which makes him leader of the dominion, and he's also a tough negotiator and diplomat. If those are the traits which make him a good leader, then that confirms the level of competition which exists among the dominions. We may still have leverage. I would suggest that now the cat's out of the bag you play it straight, Joshua. Tell him what we want. Frankly, what have we got to lose at this point?"

Joshua took a breath. Even with Ruben's unarguable summary, he couldn't bring himself to gamble the outcome of their mission on a xenoc's generosity. Especially when they had confirmed virtually nothing the Mosdva had told them about Mastrit-PJ's history, nor even their own nature. "I congratulate you, Quantook-LOU," he said. "That is an admirable deduction from such a small amount of information. Although not entirely correct. I will profit considerably from introducing some of your technology to the Confederation."

"Why are you here?"

"Because of the Tyrathca. We want to know where they are, how far their influence extends, how many there are of them."

"Why?"

"At the moment our Confederation co-exists alongside them. Our leadership believes this situation cannot last forever. We know they have conquered entire sentient species

as they spread from star to star, either enslaving them as they did you, or exterminating them. We were fortunate that our technology is superior, they did not threaten us when we first encountered them. But they already have our propulsion systems. Conflict is inevitable if they continue to expand. And any further expansion must be outward, through our worlds. If we know their extent while our starships remain superior, we may be able to terminate that threat.”

“What is your propulsion system? How fast do your ships travel?”

“They can jump instantaneously between star systems.”

Quantook-LOU’s reaction was enough for Joshua to class him as human, or as near as made no difference. The xenoc emitted a piping squeal, the fore and mid limbs clapping urgently against his front torso.

“I am glad I have no eggs in my pouch,” Quantook-LOU said when he had quietened. “I would surely have cracked them.” Marsupial? Joshua wondered idly.

“Do you realize what you have in your ship, Captain Joshua Calvert? You are our salvation. We considered ourselves trapped here orbiting this dying star, encircled by our enemies, never to escape as they did. No more.”

“I take it you’d like to acquire our propulsion technology?”

“Yes. Above all things. We will join your Confederation. You have seen our numbers, our ability. Even with our limited resources, we are vast and powerful. We can build a million warships, a hundred million, and equip them with your propulsion system. The Tyrathca are slow and stupid, they will never match us in time. Together we can embark on a crusade to rid the galaxy of their evil.”

“Oh Jesus wept,” Joshua exclaimed over the communication link. “It just keeps getting better. We’re going to let loose a cosmic genocide if the Mosdva ever get ZTT technology. And I’ve a feeling the four of us might not be al-

lowed back to *Lady Mac* until Quantook-LOU has the relevant data.”

“We can shoot our way through the bubble,” Samuel said. “Get outside and wait in the structure until *Lady Mac* can pick us up.”

“It’s not that stressful,” Liol said. “We can give Quantook-LOU any old file full of shit. Hand over the schematics for a deluxe, ten-flavour ice cream maker if you want. He’s not going to know the difference until we’re long gone.”

“That’s my brother.”

“Right now, you’ve got more immediate troubles. We think the dominions are having some kind of armed conflict. The number of tube breeches is reaching epidemic proportions out here.”

“Fucking wonderful.” Joshua scanned round the bubble again. It wouldn’t be too much trouble to break out. And he hadn’t seen a Mosdva in a spacesuit. Yet. “I am prepared to offer you our propulsion system,” he told Quantook-LOU. “In return, I must have all your information concerning the Tyrathca flightships and the stars they colonized. This is not negotiable. They were sending messages back to this star for thousands of years. I want them, and the stellar coordinate system they used. Provide that for me, and you can have your freedom to roam the galaxy.”

“Obtaining that information will be difficult. The dominion of Anthi-CL does not keep many Tyrathca files of such antiquity.”

“Perhaps other dominions will have what I require.”

Joshua’s suit sensors picked up the agitated movements of the seven other Mosdva in the bubble with them.

“You will not deal with another dominion,” Quantook-LOU said.

“Then find out where that information is kept, and trade for it.”

“I will examine the possibility.” Quantook-LOU used a

mid-limb to grasp a pipe rim on the surface of the bubble. Five of the electronic modules worn on his harness sprouted slim silver cables. Their ends swung round blindly, and they began to wind through the air with a serpentine wriggle, heading for one of the electronic units bolted to the piping. They plugged themselves into various sockets, and the pattern of lights on the unit's surface changed rapidly.

"Crude, but effective," Ruben commented. "I wonder how far their neural interface technology extends."

"Captain," Beaulieu called. "We're seeing what looks like troop movements around the Anthi-CL dominion."

"You've got to be shitting me."

"Mosdva in spacesuits are crawling along the darkside structure. There is no fabrication or maintenance equipment accompanying them. They are most agile."

Joshua didn't even want to ask what kind of numbers were involved. "Sarha, go to flight readiness status, please. If we need you, we'll need you fast."

"Acknowledged."

"How long do we wait?" Oski asked.

"Give Quantook-LOU another fifteen minutes. After that, we're out of here."

But the Mosdva stirred after only a couple of minutes. Three of his five cables unplugged themselves, and wound back into their harness modules. "The dominion of Anthi-CL has five files relating to the information you want."

Joshua held up a communication block. "Transmit them over, we'll see if that's enough."

"I will release the index only. If this is what you require, we must discuss how to complete the exchange."

"Agreed." His neural nanonics monitored the short dataflow from the bubble's electronics into his block. Syrinx and *Oenone* examined the data eagerly.

"Sorry, Joshua," she said. "These are just records of messages transmitted by the arkships. Standard updates on how

the voyages are progressing. There's nothing of any relevance here."

"Any messages sent from Swantic-LI?"

"No, we didn't even get that lucky."

"This information is no good," Joshua told Quantook-LOU.

"There is no more."

"Five files, in the whole of Tojolt-HI? There must be more."

"No."

"Perhaps the other dominions won't allow you access to their databases. Is that why you're all at war?"

"You have brought this upon us. It is for you we die. Give me the propulsion system. End all our suffering. Does your species have no compassion?"

"I have got to have the information."

"Where the Tyrathca live, what planets they have colonized, is irrelevant now. If we have your propulsion system, they will never threaten you again. You will have accomplished your aim."

"I will not give you the propulsion system without receiving the information in exchange. If you cannot provide it, I will find a dominion that will."

"You may not deal with another dominion."

"I do not wish our association to end in threats, Quantook-LOU. Please find the information for me. Surely an alliance with another dominion is a small price to pay for the freedom of all Mosdva."

"There is a place on Tojolt-HI," Quantook-LOU said. "The information you want might still be stored there."

"Excellent. Then plug in, and make the deal. Anthi-CL has obtained enough new technology from us to buy another dominion."

"This place has no link to the dominions any more. We expelled it long ago."

“All right, time to say hello again. We’ll go there and access the files direct.”

“I cannot take you beyond our borders. I no longer know which of our allies remain trustworthy. Our train may not be allowed to pass.”

“You forget. I’ve already invited you to visit my starship. We’ll fly. It’s quicker.”

Valisk continued to fall through the dark continuum. The ebony nebula outside flickered with faint bolts of phosphorescence, illuminating the giant habitat’s exterior with a feeble glimmer of luminescence as it passed through. Had there been anyone out there who cared, they would have been saddened by how dilapidated it had become. The girders and panels of the counter-rotating spaceport appeared to be fraying with age; around the port’s periphery solid matter was decaying into sluggish liquids. Large dank droplets dripped away from the eroded, tapering ends of titanium support struts, gusting away into the depths of the nebula.

Intense cold was punishing the polyp shell badly, devouring the internal heat faster than it could be replenished. Slim cracks were opening up everywhere across the surface, some of them deep enough to reach the outer mitosis layer. Thick tar-like liquids bubbled up through them in places, staining the outer surface an insalubrious sable. Occasionally a chip of polyp would flake away from the edge of a new fissure, drifting away listlessly, as though velocity too was subject to increased entropy. Worst of all, twelve jets of air were fountaining undiminished out of broken starscraper windows, spraying the icy gas in long wavering arcs. They’d been there for days, acting like a beacon for any new Or-gathé who glided out of the nebula’s labyrinthine nucleus. The big creatures would squirm their way through to the interior, blocking the blast for a few seconds as they crammed in through the empty rim.

Erentz and her relatives all knew about the shrinking atmosphere, but there was nothing they could do to halt it. The darkling habitat cavern belonged to the Orgathé and all the other creatures they'd brought with them. In theory the humans could have made their way to the starscrapers via the tube lines and water ducts. But even if they managed to seal up some of the breaches, the arriving Orgathé would simply smash through new windows.

Five caverns deep in the northern endcap had become the last refuge of the surviving humans, chosen because each one had only a couple of entrances. The defenders had adopted a Horatius strategy. A few people armed with flame throwers and incendiary torpedo launchers stood shoulder to shoulder and saturated the passageway with fire whenever one of the creatures tried to get through. Human ghosts hung back during each battle, waiting until the creature retreated before they scampered forward to absorb the sticky fluid it had shed, giving themselves substance again. They formed a strange alliance with the living humans, warning them when one of the dark-continuum creatures was approaching. Though none of them could be persuaded to do anything else.

"Can't say I blame them," Dariat told Tolton. "We're as much a target to the creatures as anybody else." He was one of the very few solid ghosts allowed in the refuge caverns. And even he preferred to skulk about in the small chamber Dr Patan and his team used rather than face the ailing, strung-out bulk of the population.

The habitat personality along with Rubra's remaining relatives had consolidated their survival policy around the single goal of protecting the physics team. A cry for help to the Confederation was their only hope now. And given the state of the habitat, time was short.

Tolton had become afraid to ask for progress reports. The answer was always the same. So he hung around with Dariat, unrolling his sleeping bag in the corridor outside the

physicists' chamber, as close to their last chance as he could be without actually getting in the way. The personality or Erentz would give him the odd task to do, where he had to go out into the big cavern again. Usually it was moving some bulky piece of equipment about, or assisting with their small stock of rations. He also stripped and cleaned torpedo launchers ready for the defenders, surprised by how good he was at something so mechanical. At the same time, it meant he knew how low their ammunition was.

"Not that it matters," he complained to Dariat as he flopped down on his sleeping bag after a session cleaning the weaponry. "We'll suffocate long before then."

"The pressure is down by nearly twenty per cent now. If we could just find some way of sealing the starscrapers, we'd stand a better chance."

Tolton took a deep breath, exhaling slowly. "I don't know if I can tell yet, or if I'm just imagining the air's thinner because I know that's what I should be feeling. Mind you, with that smell coming from next door, who knows."

"Smell is one sense I haven't regained."

"Take my word for it, in this case that's a blessing. Ten thousand sick people who haven't had a bath for a month. I'm amazed the Orgathé don't turn tail and run screaming."

"They won't."

"Is there any way we can fight back?"

Dariat squatted down. "The personality has considered pumping the light tube."

"Pumping?"

"Divert every last watt of electricity into heating the plasma, then switch off the confinement field. We did it before on a small scale. In theory, it should vaporise every fluid-formed creature in the habitat cavern."

"Then do it," Tolton hissed back.

"Firstly, there's not much power left. Secondly, we're worried about the cold."

“Cold?”

“Valisk has been radiating heat out into this Thoale-cursed realm ever since we got here. The shell is becoming very brittle. Pumping the light tube is like letting off a bomb inside; it might shatter.”

“Great,” Tolton griped. “Just fucking great.” He had to pull his feet in as three people staggered past, carrying a not-so-small microfusion generator between them. “Is that for the pumping?” he asked once they’d passed.

Dariat was frowning, watching the trio. **What are they doing?** he asked the personality.

They’re going to install the generator back in the Hainan Thunder.

Why?

I’d thought that was obvious. Thirty of them are going to fly it the hell away from here.

Which thirty? he asked angrily.

Does it matter?

To the others it will. And me.

Survival of the fittest. You shouldn’t complain, you’ve had a damn good run.

What’s the point? The starships are damn near wrecks. And even if they do get a drive tube running, where are they going to go?

As far as they can. The *Hainan Thunder*’s hull is still intact, it’s only the protective foam which is peeling off.

So far. Entropy will eat through it. The whole ship will rot away around them. You know that.

We also know it has functional patterning nodes. Maybe the pattern can be formatted to get a signal out to the Confederation. Some kind of energy burst that can punch through.

Holy Anstid, is that what we’re reduced to?

Yes. Happy now?

“They need the generator over in the armoury,” Dariat said. “Their power supply packed in.” He couldn’t look the street poet in the eyes.

Tolton grunted indifferently, and pulled the sleeping bag round his shoulders. When he breathed out, he could see his breath as a white mist. “Damn, you were right about the cold.”

Can Tolton go with them? Dariat asked.

We’re sorry.

Come on, you are me. Part of you, anyway. You owe me that much out of sentiment. And he was the one who got our relatives out of zero-tau.

Do you imagine he will want to go? There are thousands of children cowering in the caverns. Would he walk past them to the airlock without offering to exchange places?

Oh shit!

If there is to be a token civilian on board, it won’t be him.

All right, all right. You win. Happy now?

Lady Chi-Ri wouldn’t approve of bitterness.

Dariat scowled, but didn’t answer. He went into the neural strata’s administrative thought routines to examine the ships which were still docked at the spaceport. Most of the spaceport’s net had failed, leaving only seven visual sensors operational. He used them to scan round, locating four starships and seven inter-orbit vessels. Of all of them, *Hainan Thunder* was the most flightworthy.

Wait now, the personality said.

The sheer surprise in the thought was so unusual that all the affinity-capable stopped what they were doing to find out what had happened. They shared the image collected by the few external sensitive cells that were still alive.

Valisk had reached the end of the nebula and was slowly sliding out. Its boundary was as clearly defined as an atmo-

spheric cloud bank. A plane of slow-shifting grainy swirls stretching away in every direction as far as the sensitive cells could discern. Slivers of pale light trickled among the dull gibbous braids, an infestation of torpid static.

There was a gap of perfectly clear space extending for about a hundred kilometres from the end of the nebula.

What is that? a badly subdued personality asked.

Another flat plane surface ended the gap, running parallel to the nebula, and extending just as far. This one was hoary-grey and looked very solid.

Visual interpretation subroutines concentrated on the sight. The entire surface appeared to be moving, seething with tiny persistent undulations.

The mélange, Dariat said. Dread made his counterfeit body tremble as memory fragments from the creature in the lift shaft surfaced to torment him. **This is where everything finishes in this realm. The end. Forever . . .**

Get the *Hainan Thunder* launched, the personality ordered frantically. **Patan, you and your people evacuate now. Send a message to the Confederation.**

“What’s happening?” a puzzled Tolton asked. He looked along the corridor as semi-hysterical shouting broke out in the physicists’ chamber. A stack of glass tubing crashed to the ground.

“We’re in trouble,” Dariat said.

“As opposed to what we’re in now?” Tolton was trying to make light of it, but the ghost’s conspicuous fear was a strong inhibitor.

“So far our time here has been paradise. This is when the dark continuum becomes personal and eternal.”

The street poet shuddered. **Help us,** Dariat pleaded. **For pity’s sake. I am you. If there’s a single chance to survive, make it happen.**

A fast surge of information came pouring through the affinity bond, running through his mind with painful inten-

sity. He felt as if his own thoughts were being forced to examine every cubic centimetre of the giant habitat, stretching out to such a thinness they would surely tear. The flow stopped as fast as it began, and his attention was twinned with the personality's. They looked at the spindle which connected the habitat to the counter-rotating spaceport. Like most of the composite and metal components of the habitat, it was decaying badly. But near the base, just above the huge magnetic bearing buried in the polyp, five emergency escape pods were nesting in their covered berths.

Go, the personality said.

"Follow me," Dariat barked at Tolton. He began to jog along the passage towards the main cavern, moving as fast as his bulk would allow. Tolton never hesitated, he jumped to his feet and ran after the solid ghost.

The main cavern was in turmoil. The refugees knew something was wrong, but not what. Assuming another attack from the Orgathé, they were shuffling back as far as they could get from the two entrances. Electrophorescent strips on the ceiling were dimming rapidly.

Dariat headed for the alcove which served as an armoury. "Get a weapon," he said. "We might need it."

Tolton snatched up an incendiary torpedo launcher and a belt of ammunition for it. The pair of them headed for the nearest entrance. None of the nervous defenders questioned them as they raced past. Behind them, they could hear Dr Patan's team shouting and cursing as they ran across the cavern.

"Where are we going?" Tolton asked.

"The spindle. There's some emergency escape pods left that didn't get launched last time I left in a hurry."

"The spindle? That's in freefall. I always throw up in freefall."

"Listen—"

“Yes yes, I know. Freefall is a paradise compared with what’s about to happen.”

Dariat ran straight into a group of ghosts waiting at a large oval junction in the passage. They couldn’t see the mélange, none of them were affinity capable, but they could sense it. The aether was filling with the misery and torment of the diminished souls it had claimed.

“Out of my way!” Dariat bellowed. He clamped his hand over the face of the first ghost, pulling energy out of her. She screamed and stumbled away from him. Her outline rippled, sagging downwards with a soft squelching sound. The others backed off fast, staring in wounded accusation with pale forlorn faces.

Dariat turned off down one of the junction’s side passages. Light from the overhead strips was fading rapidly now. “You got a torch?” he asked.

“Sure.” Tolton patted the lightstick hanging from his belt.

“Save it till you really need it. I should be able to help.” He held up a hand and concentrated. The palm lit up with a cold blue radiance.

They came out into a wider section of the passage. There’d been some kind of firefight here; the polyp walls were charred, the electrophorescent strip shattered and blackened with soot. Tolton felt his world constricting, and took the safety off the launcher. Dariat stood in front of a closed muscle membrane, barely his own height, that was set into the wall. He focused his thoughts and the rubbery stone parted with great reluctance, the lips puckering with trembling motions. Air whistled out, turning into a strong gust as the membrane opened further.

There was no light at all inside.

“What is this?” Dariat asked.

“Secondary air duct. It should take us right up to the hub.”

Tolton shuddered reluctantly, and stepped inside.

Valisk had cleared the nebula, its great length taking sev-

eral minutes to complete the transfer into clear space. The spaceport was the last section to leave it behind. Four lights gleamed brightly around the rim of the docking bay which held the *Hainan Thunder*, four in a ring of at least a hundred. Nonetheless, they were extraordinarily bright in this dour environment. Their tight beams fell on the hull, revealing patches of bright silver-grey metal shining through the scabby mush of thermal protection foam that was moulting away in a glutinous drizzle.

The windows looking out onto the bay flickered with light as the desperate crew hauled themselves past the maintenance team offices; oxygen masks clamped to their face, torches shining ahead of them. A couple of minutes later, the starship began to show some signs of activity. Thin gases flooded out of nozzles around the lower quarter of the hull. One of the thermo dump panels slid out of its recess and started to glow a faint pink at the centre. The airlock tube disengaged, withdrawing several metres before lurching to a halt. Clamps around the docking cradle flicked back, releasing the hull.

Chemical thrusters around the starship's equator fired, sending out shimmering plumes of hot yellow gas. They tore straight through the bay's structural panels, creating a vicious blowback of atmospheric gas from the life-support sections. The *Hainan Thunder* rose out of the bay atop a thick geyser of churning white vapour.

More powerful chemical rockets ignited, propelling the starship away from the spaceport. One of them exploded, its combustion chamber weakened by exposure to the dark continuum. The starship pitched to one side, then recovered. It began to climb steadily towards the nebula.

An Orgathé swooped out from the percolating gunge and descended on the starship. Its talons tore through the hull plates, shredding the equipment underneath. The rockets

died amid a shower of sapphire sparks. Fluids and vapour streamed out from deep clefts.

A second Orgathé joined the first, the huge creatures tugging the starship violently between them. Big chunks of metal and composite were ripped free, twirling off into the void. The creatures were eagerly clawing their way through the tanks and machinery to reach the life support capsules and the kernels of life-energy cowering inside.

There was a final spew of gas as the capsules were punctured, then the Orgathé were still as they consumed their ephemeral meal.

The habitat personality had little time for remorse, or even anger. It was watching the surface of the mélange as it grew closer. The incessant motion was becoming clearer, an agitated ocean of thick fluid. Closer, and a billion different species of xenocs were drowning in that ocean, their appendages, tentacles, and limbs writhing against each other as they strove to keep afloat. Closer still, and the bodies were actually forming themselves from the fluid and clawing madly to lift themselves into the void above, a brief existence of useless strife and wasted energy before they collapsed and dissipated back into the mélange. If they were lucky, peaks would arise as souls merged together, combining their strength as they sacrificed identity. Those at the pinnacle stretched themselves further and further, quivering to break free. Only once did the personality see an Orgathé, or something similar, sweep upwards, newborn and victorious.

When we hit that, the amount of energy we contain is going to blow a hole clean through to the other side, the personality said shakily.

There is no other side, Dariat said. **Just as there is no hope.** Every part of his body ached from the climb up through the air duct. He had forced himself to keep going, at first hiking up the slope, then as the gravity fell off, pulling himself along a near-vertical shaft with his arms.

Then why do you keep going?

Instinct and stupidity, I suppose. If I can delay entry into the mélange by a day, then that's a day less suffering.

A day out of eternity? Does that matter?

To me, now. Yes. It matters. I'm human enough to be terrified.

Then you'd better hurry.

The southern endcap was within twenty kilometres of the mélange. Ahead of it, the surface was churning with activity. Huge peaks were jabbing up as melting bodies climbed on top of each other so they could be the first to touch the shell and feast on the life-energy within.

Dariat reached the end of the duct and commanded the muscle membrane to open. They air-swam out into one of the main corridors leading to the hub chamber.

Tolton had fastened his lightstick to the launcher, as he'd seen Erentz do. He swept the beam round the black corridor in an alert fashion. "Any bad guys around here?"

"No. In any case, they're all waiting for the impact. Nothing's moving in the habitat."

"I'm not surprised. I can taste the horror; it's physical, like I've overloaded on downer activants. Shit." He smiled brokenly at Dariat. "I'm frightened, man. Really frightened. Is there any way a soul can die here, die completely? I don't want to join the mélange. Not that."

"I'm sorry. It can't be done. You have to live."

"Fuck! What kind of a universe is this anyway?"

Dariat led Tolton into the darkened hub chamber and held his hand high, letting the energy pulse recklessly. The resulting burst of light revealed the geometry: silent doors leading to the spindle commuter cabs, hoop avenues down to the tube train stations. He aimed himself at a door leading to the engineering section and kicked off.

The corridors on the other side were metal, lined with

grab hoops. They slithered along them quickly, using the manual controls to get past airlock hatches. The air was freezing but breathable. Tolton's teeth started chattering.

"Here we go," Dariat said. The escape pod's circular hatch was open. He somersaulted in, vaguely unnerved by the familiar layout. Twelve acceleration couches were laid out around him. He chose the one under the solitary instrument panel and started flicking switches. Same sequence as last time. The hatch hinged shut automatically. Lights came on with reluctance, and the environment pumps started to whine.

Tolton held his hands up in front of the grille, catching the warm air. "God, it was *cold* out there."

"Strap in, we're about to leave."

The personality watched the tip of the southern endcap touch the surface of the melange. **I am proud of all of you**, it told Rubra's descendants.

Fluid cratered away from the impact, then rushed back to slam against the shell. Hundreds of thousands of berserk souls surfed it inwards and penetrated the polyp to immerse themselves in the magnificent tide of life-energy coursing within, absorbing it directly. The temperature difference between fluid and polyp was too great for the habitat's weakened shell to withstand. The existing fissures flexed wildly as thermal stresses tightened their grip.

Dariat activated the pod's jettison sequence. Explosive bolts cut away the berth's outer shielding, and five of the solid rockets fired. They were flung clear of the spindle, racing out level with the surface of the melange.

Goodbye, the personality said. The accompanying sorrow brought tears to Dariat's eyes.

Valisk burst apart as if a fusion bomb had detonated inside. Thousands of human souls came fluttering out of the billowing core of hot gas and crumbling polyp slabs, indestructible phantoms naked in the darkness. As with all life in

the dark continuum, they sank into the *mélange* and began their suffering.

The solid rocket burn ended, leaving the escape pod in freefall. Dariat looked out of the small port, seeing very little. He twisted the joystick, firing the cold gas thrusters to roll the pod. Grey smears slashed past outside.

“I can see the *mélange*, I think,” he reported faithfully. In his mind he was aware of the wailing and torment gushing from the awesome conglomeration of pitiful souls. It chilled his own resolution. There could be only one fate here.

Amid the misery were several steely strands of more purposeful and malignant thought. One of them was growing stronger. Nearer, Dariat realized. “Something’s out there.” He tilted the joystick again, spinning the pod quickly. Pale blooms of light emerged deep inside the nebula, silhouetting a speck that whirled and shook as it arrowed towards them.

“Shit, it’s one of the *Orgathé*.” He and Tolton stared mutely at each other.

The street poet twitched feebly. “I can’t even say it’s been fun.”

“There are five solid rockets left. We can fire them and fly back into the nebula.”

“Won’t we just wind up here again?”

“Yes. Eventually. But it’ll be another day or two out of the *mélange*.”

“I’m not sure it makes that much difference to me now.”

“Then again, we could fire them when the *Orgathé* reaches us, fry the bastard.”

“It’s only doing what we’d do.”

“Last choice, we can fire the rockets to take us into the *mélange*.”

“Into! What use will that be?”

“None whatsoever. Even if we don’t break apart on impact we’ll melt away into the fluid over a few days.”

“Or fly straight through to the other side.”

“There isn’t one.”

“You never know unless you try. Besides, this way has the most style.”

“Style, huh.”

They both grinned.

Dariat rolled the pod again, getting a rough alignment on the *mélange*. He fired two of the solid rockets. Any more, and they really would crack open when they reached it.

The cold will probably do it anyway, he thought.

There was three seconds of five-gee acceleration, then they hit. The deceleration jolt was fearsome, flinging Tolton against the couch’s straps. He groaned at the pain, bracing himself for the worst.

But the pod’s thermal coating held, defying the devastating subcryonic temperature of the *mélange*. The pod juddered sluggishly as its rocket motors continued to fire, thrusting them deeper and deeper below the surface. Both of them could hear the cacophony of souls outside, their shock and dismay as the rocket exhaust vaporized the fluid in which they were suspended. The cries grew fainter the further in they went. After fifteen seconds the rockets burnt out.

Tolton’s laugh had an unstable timbre. “We made it.”

The port had frosted over as soon as they struck the fluid. He reached over and tried to wipe the beads of ice clear. His hand stuck to the glass. “Bugger!” He lost some skin pulling it free. “Now what do we do?”

“Absolutely nothing.”

25

The Volkswagen Trooperbus carried Louise and Ivanov Robson back to London. During most of the four-hour trip she'd sat curled up on one of the big leather chairs in the cabin, accessing news reports from the arcology. The landscape held little interest for her now.

There were few rover reporters left in the Westminster dome to provide an impression of what was happening. Those who insisted on toughing it out were releasing their senseises on a long delay, allowing them to get well clear of the area where they'd been recording. The possessed didn't take kindly to having their activities exposed to the planet's accessing public. Rovers who'd been caught on the first day had never accessed the net again.

What was shown by reporters still on the ground—and more comprehensively, by the dome sensors—was a rough kind of order establishing itself among the ancient buildings. The possessed were organized in small bands, walking quite openly along the main roads. It was a defiant gesture up at Govcentral. They could have been targeted easily by SD weapons, had the political will existed to do so. But as there were only ever a couple of hundred exposed at any one time,

the remainder would be free to extract an atrocious retribution on the rest of the non-possessed population. Government forces within the arcology had been effectively eliminated. Highly specific fires had continued to rage throughout the night, disposing of all the dome's police stations and eighty per cent of the local council offices. Significantly, although power grids and the communication net had also been targeted, the possessed hadn't damaged any of the primary civic utility stations. There was still water, and fresh air; and the dome remained capable of warding off an armada storm. Somebody was controlling the possessed, ordering their activities with a great deal of precision.

The media speculated on who.

Charlie was only interested in why. If anything, the possessed were now enforcing the original curfew with a greater efficiency than the police ever had. The AI's analysis of their movements indicated there were between seven and ten thousand of them, each with their own area to control. Enough to make sure everyone stayed indoors. Very few new possessed were being created, and there were barely a few hundred in the nine outer domes.

The only significant excursion they'd attempted was to a garage of surface vehicles. Each time they'd driven one of the lumbering machines up onto the ramp, it had been targeted by SD fire. The President himself had ordered the strikes without any urging from the B7 staff among his advisors and cabinet. The possessed had made eight attempts to leave London before giving up.

"Dexter's preparing for something," Charlie told Louise just before she left his dome. "There's no way he'll be satisfied with just London. That's why he's holding back on possessing the rest of the population. The way he's put things together in there, he could do it in less than a week if he wanted. He's far better organized than New York."

Louise didn't understand why Dexter was holding back

any more than Charlie did. The devilsome man she'd encountered back on Norfolk didn't seem capable of any restraint.

The only other information she received on the trip was progress reports on Genevieve. Her sister was being driven to Birmingham in another Volkswagen, along with Divinia and the first batch of Charlie's family. From there Charlie had arranged a vac-train to take them to Kenya Station. Gen had been quite disappointed when it turned out that Charlie's dome couldn't fly.

It was a much shorter drive to Birmingham. Genevieve was on the African Tower ascending to Skyhigh Kijabe while Louise was still making her way across the Thames valley.

"Coming into view now if you want to see it," Yves Gaynes called out from the cab.

Louise stirred herself and went forward to sit next to him. When they'd left London, she'd had a poor view of the domes; the direction they were travelling in was all wrong. Now the Trooperbus was pointing straight at them as it lumbered over the last few miles.

She stared at the domes that sliced up out of the rolling horizon. Only the outer nine were visible, gathered protectively around the ancient city at the centre. The sinking sun reflected vivid pillars of copper light off the vast arcades of geodesic crystal; other than that, they were completely black. For the first time, she could appreciate just how artificial they were. How alien.

Yves was looking at her. "Didn't expect to be coming back this way quite so soon, myself."

"No."

"The boss does look after his people, you know."

"I'm sure he does." Not that she was convinced she really qualified as a B7 staff member. Then again, it could just be Charlie remote-controlling the driver, trying to reassure her,

to make her more compliant. She wasn't certain of anything anymore.

The Trooperbus drove steadily past the half-buried factory halls surrounding the arcology and dipped down a ramp into one of the huge underground garages. There were few lights on, and no activity at all among the ranks of parked vehicles. They drew up in a bay near the ramp. As the external door slid down, a navy blue car sped towards them out of the gloom. Ivanov Robson stood up and popped the cabin's hatch.

"Are you ready?" he asked politely.

"Yes." Louise made her voice cool. She hadn't spoken to him since the journey started. It was an issue dominated by anger; although she wasn't sure who she was directing it against. Him for being what he was, or her for liking him at the start. Maybe he was just too strong a reminder that she'd been so thoroughly manipulated.

She climbed down the short ladder. It was humid in the garage, but colder than she expected. She was dressed for the arcology in a short skirt over black leggings, with a long sleeved emerald T-shirt to cover the medical nanonic bracelet and thin leather waistcoat. Her hair had been batted down into a single ponytail.

Ivanov followed as she hurried over to the car, carrying the slim alligator-skin weapons case Charlie had given him. A policewoman ushered them into the car, her face devoid of curiosity. How many people have B7 sequestered? Louise wondered. This time the car's interior was quite ordinary. She settled back in the rear seat with Ivanov beside her, the fateful case resting on his knees.

"I am me most of the time, you know," he said quietly. "B7 can't control my every waking second."

"Oh." Louise didn't want to talk about it.

"I regard it as a penance, not a punishment. And I get to see some interesting things. I also know how the world

works, a rare privilege for anyone these days. As you now know.”

“What did you do?”

“Something very foolish, and unpleasant. Not that I had a lot of choice at the time. It was them or me. I think that’s why B7 gave me this deal. I’m not what you’d call a standard career criminal. I even had a family. Haven’t seen them for a couple of decades, but I’m allowed to know how they’re getting on.”

“But you were still told how to treat me.”

“I was ordered what information to supply to you, and when. Everything else I ever said or did was the real me.”

“Including coming back to London now?”

Ivanov chuckled quietly. “Oh no. Natural altruism doesn’t run to this insanity. I’m here under orders.” He paused. “But now I’m here, I will do my best to protect you if the need arises.”

“You think coming back was stupid?”

“Completely idiotic. B7 should toughen up and nuke London. It’s the only way we’ll ever be rid of these possessed.”

“That kind of weapon won’t work against Quinn Dexter.”

“Is that so?” A long finger stroked the alligator-skin case slowly. “Do you trust this Fletcher guy we’re going to meet?”

“Of course. Fletcher is a decent and kind man. He looked after Gen and I all the way from Norfolk.”

“Should be interesting,” Ivanov mumbled. He turned to watch the concrete wall of the tunnel slip past outside the car.

They arrived at a small vac-train freight station somewhere in one of the arcology’s underground industrial zones. Charlie had selected it because there was a direct road from the garage, and the net was still functioning in that sector.

The platform was a lot narrower than those at Kings

Cross, with large units of heavy-duty cargo handling machinery standing by every airlock. When Louise and Ivanov emerged out of a service lift, eight GISD field agents were waiting for them, each equipped with a static bullet machine gun.

The train arrived five minutes later. Only one airlock door opened. Detective Brent Roi stepped out first, looking round suspiciously. When his gaze found Louise, his expression told her he was officially the unhappiest person on the planet.

“Out,” he snapped over his shoulder.

Fletcher Christian emerged from the airlock, dressed in his immaculate naval uniform. Two guards were right behind him, and there was a thick metal collar clamped round his throat. Louise didn’t care, under the stiff gaze of the field agents she ran over and flung her arms round him.

“Oh God, I missed you,” she blurted. “Are you all right?”

“Hardy enough, my dearest Lady Louise. And you? How have you fared since we parted last? More unsuitable adventures, I’ll warrant.”

She was wiping tears off against his lapels, the buttons on his jacket pressing into her skin. “Something like that.” She clutched him tighter, amazed by how glad she was to see him, the one person she really trusted on the whole planet. His hand stroked the back of her head.

“Jesus wept,” Brent Roi exclaimed in disgust.

Louise let go and took a timid step back. Fletcher’s mournful eyes showed he understood.

“You two finished?”

Ivanov stepped forwards. “Try picking on me,” he said to the Halo detective.

“Who the hell are you?”

“Put it this way, we share the same supervisor. And if you had a high enough security rating to be told what Louise has done for us, you’d display some respect there as well.”

Fletcher was looking at the hulking private detective with some interest. Ivanov thrust his hand out. "Pleased to meet you, Fletcher. I'm the guy who's been looking out for Louise down here." He winked at her. "When circumstances allow me to."

Fletcher bowed. "Then you do us all a service, sir. I would be sorely grieved if any harm befell such a treasured flower."

Brent Roi sighed in disbelief. "You want to get on with this?"

"Sure," Ivanov said. "We'll take over from you. I doubt I have to sign for him, right?"

"Take over? As in my part's finished? It's not that goddamn easy. I haven't got any way of getting back to the Halo. I'm fucking stuck here escorting this jerk."

Louise was about to tell him B7 could get him back up the orbital tower, then she saw Ivanov's face go blank momentarily. Charlie must be telling him something.

"Okay," Ivanov said sadly. "But just so you know, it wasn't my idea."

"That makes me feel a whole lot better."

Louise sat next to Fletcher when they got back to the car. Ivanov and Brent took the jump seats opposite.

"It's your show," Ivanov told Fletcher. "How do you want to play this?"

"Wait a minute," Louise said. "Fletcher, what's that collar?"

"Pacifier," Brent grunted. "If he gets fruity, I can slam a thousand-volt charge through him. Believe me, that makes these possessed bastards sit up and take notice."

"Take it off," she demanded.

"Lady Louise—"

"No. Take it off. I wouldn't treat an animal like that. It's monstrous."

“While I’m near him, it stays on,” Brent said. “You can’t trust them.”

“Charlie,” Louise datavised. “Tell them to take it off. I’m not joking. I won’t cooperate any further until you stop treating Fletcher like this.”

“Sorry, Louise,” Charlie replied. “The Halo police were jumpy. It was only supposed to be while he was in transit.”

She watched Brent’s expression darken as he received a datavise from Charlie. “Fuck it all,” he spat. There was a click from Fletcher’s collar, and the locking mechanism rotated ninety degrees. Fletcher reached up and tugged at it experimentally. It came away in his hands.

“Hey.” Brent slid the front of his jacket to one side, revealing a shoulder holster containing a very large automatic pistol. Three reserve clips had small red lightning emblems on them. He stared at Fletcher. “I’m watching you.”

Fletcher placed the collar disdainfully on the floor between them. “Thank you.”

“No problem,” Ivanov said. “We want you comfortable.”

“You mentioned a weapon, Lady Louise.”

“Yes, the Confederation Navy have designed something that destroys souls. They want you to try and get close enough to Dexter to shoot him with it.”

“True death,” Fletcher said in wonder. “There are many who would welcome that right now. Are you certain such a device works?”

“That’s confirmed,” Ivanov said. “It’s been tested.”

“If I might be so bold as to ask, upon whom?”

“The project director used it on himself and a possessed who was threatening him.”

“I am uncertain if that is heroism or tragedy. Did they suffer?”

“Not a thing. It’s completely painless.”

“Another example of your much-vaunted progress. May I see this fearsome instrument?”

Ivanov put the alligator-skin case on his knees and datavised the entry code. The lock bleeped, and he opened it. Five matt-black cylinders, thirty centimetres long, were nesting on the grey foam inside. He picked one out. One end had a glass lens, and there was a single flat red button on the side.

“The majority of its components are bitek, so it should be able to resist a possessed glitching it for a while. Simple operation. Push the button forward, so”— he worked it with his thumb—“to activate. Then press to fire. It will shine a narrow beam of red light, which has to strike your target’s eyes to work. Estimated effective range is fifty metres.”

“Yards,” Louise murmured with a smile.

Fletcher inclined his head in thanks.

“Whatever,” Ivanov said. He handed the weapon to Fletcher. Brent tensed up. But Fletcher simply examined the gadget with mild curiosity.

“It seems naught but a harmless stick,” he said.

“There’s plenty goes on inside that you can’t see.”

“Nor understand, I’ll warrant. However, its use is plain enough to me. Tell me, what happens to the original soul of a body when this is fired at a possessing soul?”

Ivanov cleared his throat carefully. “It does as well.”

“That is murder.”

“One death is a small price to pay for ridding the universe of Quinn Dexter.”

“Aye, the affairs of kings are not to be questioned by their subjects. For that is what makes them kings. Judged only by Our Lord.”

“Can I have one as well, please?” Louise asked.

Ivanov handed her one of the tubes without comment. She checked the trigger button briefly, then put it in an inside pocket on her waistcoat.

Ivanov took one for himself and offered Brent Roi one. The Halo detective shook his head.

“Now all we have to do is find Quinn Dexter,” Ivanov said. He looked at Fletcher. “Any ideas?”

“Do you have any notion where he might be?”

“Only a general assumption that he’s in the Westminster dome; that’s where he seems to have consolidated his grip on the other possessed. Logically he can’t be too far away from them.”

“I know of Westminster, but not of its dome.”

“Basically, the whole of the London you knew got put under a protective glass bubble. That’s the dome. He could be anywhere inside the city.”

“Then I would suggest you take me to a suitable vantage point. I may be able to determine where large groups of the possessed fester. It would be a start.”

It was the sign of a good leader that he could adapt quickly to changing circumstances. After the last couple of days, Quinn now considered himself to be ranked among history’s greatest. The curfew had come as a considerable shock, not least because it meant the supercops were on to him once more. He had a good idea who’d told them—a knowledge which was almost pleasing.

Of course, the curfew had completely screwed up his earlier plans. The possessed from the Lancini had done as they were ordered, and used the night to take over a quantity of people in the designated buildings. But then the day workers hadn’t arrived, and the game changed.

Quinn had sent runners out through the maze of tunnels and service shafts below the arcology, contacting the groups and telling them what to do next. They were to take out the police as he’d originally intended, luring them into ambushes and incinerating the precinct stations. Given their smaller numbers, it would take longer, but with the curfew conveniently shutting down the rest of the arcology the police would have little back-up or support available. He also

told his followers to target the net and power substations, further isolating the beleaguered police.

By late afternoon, deprived of police or emergency services, power and communications, the arcology's population had effectively been imprisoned in their own homes. Quinn had achieved his goal without any need to smash the transport network, utilities, and food factories.

It was almost what he'd originally intended, and achieved with fewer possessed than he'd originally estimated. That weighed heavily in his favour; it was easier to exert discipline over a smaller number. And the arcology, with all its prized resources, remained intact for him to use as he wished. His tightest control was imposed over the Westminster dome, with fear paralysing the nine outer domes, rendering them useless as possible sources of resistance.

With London secure, Quinn had made one attempt to send disciples to Birmingham in overland vehicles. The venture had resulted in SD strikes and the total destruction of the commandeered vehicles.

He knew it was never going to be that easy.

As the first night wore on, and his possessed battalions continued their mopping-up operation against the civic authorities, he had several technical and engineering experts brought to his headquarters. They were put to work on methods of travel unsusceptible to the SD platforms. A token gesture. He knew the coming war of Night would not be fought with science and machines. It would be personal and glorious, as war was meant to be.

As darkness fell, the bedlam of the demons had grown louder. Quinn supplicated himself across the desecrated altar of St Paul's cathedral and delved deep into the ghost realm once more. This time he was rewarded with the greatest knowledge there could be, so beautiful he whimpered at its impact. God's Brother Himself was awaking from His banishment at some unimaginable distance past the end of

the universe. Cries of glory and rapture rose from the demons as they welcomed their vast Lord among them, his ominous presence bringing a vigour and strength they had never known before.

Their cold dreaming thoughts infiltrated Quinn's mind. He could know them in all their astounding multitude, bound together in an enchanted torment. God's Brother arose before them, hot and dark, radiant with malevolence. They reached out for Him, to be gifted with His power. And He freed them, His energy banishing their chains so they could soar again, as they once had so long ago. An entire army of apocalyptic angels, enraptured by their new state, and hungry. Hungry for so many things they had been denied for all this terrible time. They swirled in adulation around the Light Bringer in a cyclone larger than the world, screaming their malignant pleasure at His coming.

Quinn left his ghostdreaming behind, his body solidifying to wake upon the altar just as dawn brought a grey light to the stained glass windows around him. There were tears in his eyes as he started to laugh. "Oh Banneth, you piece of shit, where are you now, unbeliever. This truth is when you'd finally despair."

"Quinn?" Courtney asked anxiously. "Quinn, you okay?"
"He's coming."

Courtney cast a glance towards the huge blackened oak doors at the far end of the cathedral. "Who?"

"God's Brother, you dumb bitch." Quinn stood on the altar and held his arms wide as he looked down on the congregation of possessed milling across the nave. "I have seen Our Lord. Seen Him! He lives. He has risen to lead us to the final victory. He brings an army that will tear down the bright metal angels guarding the sky. Night will fall!" He was shaking with conviction. Courtney watched in a kind of dread awe as he slowly looked down at her. "Don't you believe me?"

“I believe, Quinn. I always believe you.”

“Yeah. You really do, don’t you.” He jumped lightly to the stone and marble floor, a wild grin visible before the blackness exuded by his robe eclipsed his flesh. His hood swung round to face the subdued congregation. Over five hundred of them had been mustered now, waiting obediently for the dark Messiah to tell them what he wanted from them. Their numbers were added to slowly, as further non-possessed captives were brought to the cathedral via underground service tunnels. The immediate vicinity around St Paul’s had been cleared of commercial and office buildings several centuries ago, extending its gardens and moating them with a pedestrian plaza. Quinn knew damn well that if too many people crossed all that open space to enter by any of the regular doors the satellites and dome sensors would see them. The pattern would be recorded, and the supercops would become curious at why none of them ever left. So the accumulation of his power base had to proceed slowly and cautiously.

Those who were brought to him were taken down into the crypt and broken open for possession by a handful of committed followers loyal to His gospel. Quinn no longer cared whether those who struggled out from the beyond into the waiting bodies believed in the word of God’s Brother or not. As long as he was physically close by, they could be coerced.

Studying the assembled possessed, Quinn thought he might have about a third of the numbers he actually wanted for the summoning ceremony. Just reaching the ghost realm took so much energistic strength. He would never be able to smash open the gates into hell by himself.

“Where’s Billy-Joe?” he asked.

Courtney gave a sullen shrug. “Downstairs again. He likes to watch.”

“Go and fetch him for me. What I’ve seen makes it fuck-

ing important that we get more warm bodies in here for possession. I want him to get word out to the shitheads on the street, make sure they keep sending them. Nobody can afford to screw up today. This is His time now.”

“Right.” Courtney started to walk towards the door at the base of the central dome which had stairs down to the crypt. She stopped and turned back. “Quinn, what happens after?”

“After what?”

“After the Light Bringer comes and, you know, we kill everyone that doesn’t do as we say.”

“We’ll live in His Kingdom, under His light, and our serpent beasts will run free and wild for the rest of time. He will have saved us from enslavement inside the false lord’s prison city; that *heaven* the dumb-ass religions keep singing about.”

“Oh. Okay, that sounds pretty cool.”

Quinn watched her go, sensing the dull acceptance of her thoughts. Strange how her unquestioning compliance had begun to annoy him lately.

He spent the rest of the morning supervising the groups he had out on the streets, directing them to new targets. It consisted mainly of intimidating the shit out of their representatives when they turned up at the cathedral. A couple of times he slipped into the ghost realm and travelled through the arcology himself. The original Lancini possessed tried to keep the newer ones in line, sticking to their orders, but nothing they could say about him and what would happen if they didn’t play ball was as effective as when he actually materialized without warning in the middle of them. Three times he had to make examples out of dissenters. He couldn’t visit every group, but word spread fast enough, even without the benefit of the net.

When he returned to St Paul’s after midday, a couple of orgies had broken out on the nave floor: freshly arrived possessed, desperate for strong sensation. He didn’t stop them,

the defilement of such a sacrosanct place was enjoyable; it was one of the reasons he'd chosen it for the summoning. But he did limit future numbers of participants. When the possessed got carried away, they were apt to give off their glitching effect over quite a distance, and there were still some power circuits operating around the cathedral. He couldn't risk a giveaway impulse being tracked by an AI. Souls that'd possessed the bodies of police officers had reported how the net was exploited by Govcentral to hunt down possessed.

Until he had enough people to perform the summoning, he was going to practice restraint.

Quinn was watching the ghosts when Billy-Joe hurried up with a possessed called Frenkel. There were many tombs in St Paul's, dating back well over a millennia, including those lost when the original cathedral building burnt down in the great fire of AD 1666. All the incumbents were supposedly men of distinction or nobility, the old nation's finest. Or at least they might have been considered so while they were alive; Quinn thought they were just a total pain in the ass now. Oh, they had their pride, which came over in the form of resentment and hatred; but basically they were no better than all the other pathetic desolates inhabiting their insipid realm. The warriors who had fallen in defence of their king and country seemed to be in the majority of those who had lingered after death to haunt the land. They despised Quinn with a passion, knowing enough of his power to fear him. To start with they had done their best to disconcert his cohorts, especially Billy-Joe and Courtney, exerting themselves to their limit. Their chill presence made the walls bead with condensation; while the corner-of-the-eye visibility as they swooped around made the chancel's rich gold-braided fabrics flutter with anaemic life. They keened as well, like dogs

tormented by a full moon, spilling their morbid depression into the air for all to perceive.

Twice Quinn had to shunt himself into the ghost realm to deal with them. His touch alone burnt them, sending them reeling away, weakened and cowed from the contact.

Their antics had withered away, leaving them slinking round to view the gathering of possessed with mute disapproval, emitting a sullen rancour which percolated through the cathedral. Then they had began to stir, as if they themselves were the victims of an unnatural incursion. They gathered together under the central dome, twittering fearfully.

The demons were growing louder.

“Something you should hear, Quinn,” Billy-Joe said. He froze at the look of displeasure Quinn gave him for interrupting. Even Billy-Joe could see the ghosts in the nave’s energetically charged environment, shivering flames of colour that skidded uncertainly over the tiled floor. “It’s important, I swear.”

“Go on,” Quinn sighed.

Frenkel was breathing hard, and trying hard not to peer into the black gulf that was Quinn’s hood. “I’m from the Hampstead group. We saw something we thought you should know about. I got here as fast as I could, rode a maintenance cab through the tube.”

“Shit,” Quinn murmured. “Yeah yeah, very good. Get on with it.”

“There was this bunch of people sneaking round the road tunnel interchange at Dartmouth Park. They’d driven a car there, which is weird, because we haven’t got round to crapping over the route and flow processors yet. Their car must have some kind of police override code, because the curfew restrictions are still in primary mode. They got up onto the street through an inspection accessway, then they started moving through the buildings. We figured they must be lo-

cals, they know the building layouts pretty good. No one can scope them from outside; our guys were having a hard time keeping up with them when I left. We didn't take them out, because the thing is, there's six of them; and two are really like the people you told us all to look out for."

"Which two?" Quinn asked sharply.

"There's the chick with long hair, and that humping great black dude. The others are just soldiers, real hard nuts. Except one, which is where things get strange. He's possessed. And he's not from our group, we've never seen him before."

"Is he controlling the others?"

"No. They're like a team."

"Where were they going? What direction?"

"They were creeping along Junction Road when I left. Our guys are keeping tabs on them."

"Take me there." Quinn snarled. He started to glide swiftly towards the door leading to the connecting subways. "Billy-Joe, bring your hardware."

Louise was thankful that the two GSDI field agents accompanying them were equipped with communications blocks. They provided her neural nanonics a direct, secure satellite circuit to Charlie and GSDI's civil databank, circumventing the patchy net coverage in this section of the arcology. The only other reliable link they had was Ivanov's affinity bond. This way she got to see the route to Archway Tower which the B7 AI had mapped out for them.

It had been scary coming up through the accessway from the underground road tunnel, especially the thirty seconds out in the open when she had to scurry to the cover of the first building. After that, she could see not only where they were but where they were going. It was surprising how reassuring that knowledge was.

Most of the buildings had some kind of route through them, interconnecting doors—all locked—or basement ser-

vice corridors. Those that didn't, the GSDI agents were planning on simply cutting through walls with their fission blades. Even that wasn't necessary; Fletcher conjured a door into existence each time. It didn't seem to matter what the wall was, ancient brick or modern reinforced carbon-concrete, nor how thick it was. The trick made Brent Roi very uncomfortable, but it saved a lot of time. Fletcher could tell if there were people ahead of them, as well.

They wormed their way from building to building, staying away from the front rooms overlooking the road whenever possible. Going through pub lounges, shop store rooms, offices, even kitchens and one-room flats. Those people they did intrude upon greeted them with astonishment and fear. Then when they found out the little party was official in nature, they just wanted to know what the hell was going on outside. And rescue. Everybody wanted out.

That part was the worst, Louise found. The tension from being caught was survivable; tension was a state she was growing increasingly used to. But the pitiful pleas of the residents were relentless, their eyes accusing as they clutched small children to them.

"Isn't there another route?" she datavised Charlie after they left a woman and her three-year-old boy sobbing miserably. "It's awful having to refuse these people."

Brent Roi waved her through a small triangular door into a narrow disused hallway. The only light was coming through a filthy smoked-glass window above a bricked-up door.

"Sorry, Louise," Charlie datavised back. "The AI says this way is the most likely to get you there undetected by the possessed. It didn't take emotional stresses into account. Just try and tough it out. Not much further."

"Where's Genevieve?"

"They reached Skyhigh Kijabe seven minutes ago. I've

chartered a blackhawk to take her to Tranquillity. She'll be there within the hour."

Louise tapped Fletcher on the shoulder. "Genevieve's safe. She's about to depart for Tranquillity."

"I'm gladdened to hear that, my lady. Hope survives."

Ivanov reached the end of the hallway and held his hand up. "Outside road."

The two GSDI field agents moved forward to the metal door. One glanced at Fletcher.

"No one is near," he said.

The agent pressed a small block to the damp wall beside the door. It fired a narrow electron beam through the plaster and brick, then extended a microfilament with a sensor on the end. The image it relayed showed them a narrow street, deserted except for a couple of cats. With the sensor switched to infrared, the agent focused it on each visible window along the street in turn, searching for hot silhouettes. The AI had been using the overhead dome sensors to scan their immediate area the whole way, but the angle was all wrong to examine windows.

Their caution every time they had to cross a side street was adding considerably to the journey time.

"Two possibles," the agent reported, datavisaging the coordinates to his colleague. The door was opened and he ran fast across the street to the building directly opposite. Their entry point was a window covered by a security grille. Cutting the restraint bolts with a fission blade took fifteen seconds; the window catch was a mere two. The agent vanished inside with a neat roll. Brent Roi was next. Louise followed, sprinting hard across the street. According to her neural nanonics it was Vorley Road, the last open space they had to cross.

Getting in, she reminded herself. It was a long long way back to any vac-train station.

This conglomeration of buildings was gathered around

the base of the Archway skyscraper itself: a monolithic twenty-five storey tower that stood halfway up a sloping ridge of land that was topped by Highgate Hill. If it hadn't been for the buildings along the street blocking the view, they would already be able to look out over the rooftops of the old city.

Once they were inside, a service corridor took them straight to the tower's lobby. A lift was already waiting for them, door open.

"The tower's net and power are still connected," Charlie datavised. "The AI is hooked into every circuit in there. I can give you plenty of early warning if there are any glitches."

They all crammed into the lift, which rose smoothly to the upper utility level. It opened out onto a world of artificial lighting, thick metal pipes, black storage tanks, and big primitive air-conditioning machines. Ivanov led them along a metal walkway to a spiral stair. The door at the top let them out on the flat roof. A flock of scarlet parakeets took flight as they emerged, startlingly loud in the warm air.

Louise glanced round cautiously. The first rank of tall, modern skyscrapers encircling the old city were only a mile or so away to the north, their glassy faces shimmering rose-gold in the last of the twilight sun. To the south, the embargoed city swept away down the slope towards the distant Thames, a dusky mass of rooftops and intersecting walls. Patches of twinkling silvery light clung to some of the larger roads where the power hadn't yet been cut to the hologram adverts. Not a single window was illuminated, the residents preferring to stay in the dark, fearful of drawing attention to themselves.

Louise heard Fletcher laughing. He was leaning on the crumbling concrete parapet that ran round the edge of the roof, looking out towards the south.

"What is it?" she asked.

"I laugh at my own humility, lady. I look at this city which is supposed to be the closest to home I will ever come, only to find that it is the strangest vista I have encountered since my return. The word 'city' no longer encompasses the meaning it had in my time. You have the power and artifice to build such a colossus, yet it is I who has been asked to perform this scant task of finding one man."

"He's not a man. He's a monster."

"Aye, Lady Louise." The humour faded from his handsome face, and he faced the ancient city. "They're here, but of course you knew that."

"Are there many?"

"Fewer than I had supposed, but enough. I feel their presence everywhere." He closed his eyes and leant out a little further, sniffing the air. His hands gripped the top of the parapet. "There is a gathering. I feel them. Their thoughts are quietened, deliberately so. They wait for something."

"Waiting?" Ivanov asked quickly. "How do you know?"

"There is an aura of anticipation about them. And unease. They are troubled, yet unable to walk away from their predicament."

"It's him! It has to be. No one else could make a whole bunch of possessed do as they're told. Where are they?"

Fletcher took one of his hands off the parapet, leaving behind a dark sweat-stain print. He pointed along the Holloway Road. "Over yonder. I am uncertain as to how many leagues. Though they remain inside the dome. On that I would wager my hat."

Ivanov moved over to stand behind Fletcher, squinting along the direction he was pointing. "You're sure?"

"I am, sir. There."

"Okay. I've got a fix. We just need to triangulate."

"A splendid notion."

"I'll take you over to Crouch Hill. That ought to be far

enough. Then once we get a rough idea where the bastard's hiding out, we can work out a route to get you close."

"If I may suggest, I simply walk. No man would accost me in this guise, and fewer will suspect my intent."

"Walk off into the goddamn sunset," Brent said. "No fucking way."

"We can talk about it," Ivanov said. "Fletcher, you got any idea how many there are in this group?"

"I would suggest several hundred. Possibly even a thousand."

"What the hell does he want with that many in one place?"

"I can advance no rationale to elucidate Quinn Dexter's behaviour. He is, sir, quite mad."

"All right." Ivanov took a final look across the city, fixing the line Fletcher had indicated. "Let's move out."

They had just got into the lift when the AI reported an electronics glitch close to the Archway Tower. It immediately datavisaged a search update to Charlie. The glitch was occurring beside the electricity substation which distributed power to the Archway Tower among other consumers. A security camera revealed two people approaching the substation along a dark corridor.

Trouble, he warned Ivanov.

The substation door crumpled from a blast of white fire. Three more glitches appeared around the base of the Archway Tower. Sensors showed possessed moving purposefully through the subway, freight tunnel, and utilities passageway. The substation transformers exploded as a barrage of white fire pummelled into their casings.

Ivanov saw the lights in the lift flicker as the Tower's emergency power cells took over. They were just passing the nineteenth floor.

Down in the basement, the possessed were smashing every communications conduit they could find, tearing the

cables out of the wall. The AI watched the Tower's net connections fail one after the other. Independent power cells kept the internal processors running, but it could now only access them through the communications blocks carried by the GSDI field agents, cutting down on the bandwidth available for surveillance and initiating possible counter-moves.

Security sensors on the ground floor showed fifteen possessed running up the stairs into the lobby. They immediately started slinging small bolts of white fire at the sensors and any other electronic system. Just before the last camera failed, Charlie saw a lift door being broken down with considerable force.

Out, he ordered. Get out of the lift.

The AI had already established a link to the lift's controlling processor. It applied the failsafe brakes and slammed it to a halt on the thirteenth floor.

Louise yelped in shock as the lift floor abruptly tried to shunt its way upwards, accompanied by a strident alarm siren. She grasped at the handrail as she lurched against the wall.

The doors flashed open. Charlie was datavising orders to her as Ivanov was shouting: "Move it! The possessed are coming." Everyone charged out into the corridor. Black apartment doors lined both walls. Smoked-glass windows at either end let in a murky glow from the setting sun. Emergency lights shone brightly above both of the stairwell doors.

Charlie told one of the GSDI agents to leave his communication block in the corridor, tucking it away unobtrusively in a doorway, enabling the AI to maintain contact with the tower's net. "The possessed are now heading up both stairwells," Charlie datavised. "Five in one, four in the other. The remainder are waiting downstairs. You'll have to shoot your way through them. I suggest you use the anti-memory where possible."

“Gets my vote,” Ivanov said. He drew the small weapon, holding it in his left hand. His right held a compact automatic pistol.

Fletcher and Louise drew their own weapons. The agents and Brent were checking their machine guns.

Ivanov opened the stairwell door cautiously. Concrete steps with metal rails wound down the shaft in a rectangular corkscrew. The sound of running boots echoed upwards.

“They know we’re here,” Fletcher said curtly.

The AI tracked glitches rising up the stairwell and computed the approximate distance. Both GISD field agents entered the time into the trigger mechanism on their grenades and dropped them down the shaft.

Louise hunched down next to the wall, her hands pressed against her ears. Explosions roared below as the chemical shrapnel grenades detonated. Then the agents tossed their gas incendiaries over the rail. Billows of flame scoured the battered stairs, searing against the groggy possessed. Screams trilled along the length of the stairwell.

“Let’s go,” Ivanov said. He took off down the stairs.

Louise was third in line, behind one of the agents, with Brent pounding along behind her. She’d put a host of programs in primary mode, an auto-locomotion so she could tear round the stairwell corners without slipping, adrenaline suppresser working through the medical nanonic to keep her calm, weapons control so she’d be able to aim the anti-memory tube properly, peripheral motion analysis, heart-rate control as a counter to the adrenaline suppresser, making sure her straining muscles received enough blood, tactical analysis, which was synchronized with the AI. It informed her that possessed from the lobby were starting to invade the bottom of the stairwell in support of their injured comrades. After descending another two floors, the agents would drop more grenades, and they’d all switch stairwells.

A thick streamer of white fire plunged up the centre of the stairwell, its tip swelling rapidly.

Louise flung herself back from the rail. Brent and one of the agents stuck their machine guns over the edge, shooting off a suppressing deluge of static bullets.

The plume of white fire burst open, spitting out a shower of incandescent sparks. Several of them landed on Louise's legs, stinging hard as they burnt their way through her leggings. She batted at them with her free hand, putting an axon block in primary to dull the pain. Her tactical program was urging her up. Neuroiconic icons began to flash warnings about capacity reduction in her neural nanonics.

A bolt of white fire flashed like lightning. It hit the GSDI field agent who was covering the rear of the group, penetrating straight through the back of his skull to char the brain. He crumpled instantly.

Ivanov and the remaining agent whirled round, their weapons trying to find a target.

"Where the fuck did that come from?" Brent yelled.

Charlie knew there was only one answer. Instinctively, his affinity bond made Ivanov turn to face Fletcher. "Well?" the detective demanded.

"He is here," Fletcher said with trepidation. "I feel him even though he hides beyond sight."

The possessed were clattering up the stairwell again. Neural nanonics and blocks were beginning to glitch.

Charlie tightened Ivanov's grip around the anti-memory weapon. "Through here," he ordered. Ivanov went through the door to the tenth floor, arm swinging in wide arcs to cover the corridor. It was deserted, a copy of the thirteenth floor. Louise and Brent followed him while the last agent dropped a couple of grenades over the rail. They all started to run for the second stairwell. The grenades didn't go off.

"Is he still here?" Ivanov asked.

“Close,” Fletcher said. Fury and frustration boiled into his voice. “I cannot see him. The devil!”

“Shoot it where you think he is. It might work anyway.”

Fletcher stopped running and lifted the anti-memory weapon, his thumb pushing the trigger button forwards. He glanced about the sombre corridor as though trying to make his mind up. The trigger was suddenly pressed, sending a cone of bright ruby laser light stabbing out.

“It is useless,” Fletcher cried. “Useless.”

The energetic glitch had crashed just about all of Ivanov’s neural nanonics. He certainly couldn’t receive any datavises. That meant the possessed were very close now.

The AI has lost all contact with the communication blocks, Charlie said. I can’t track the possessed for you any more.

Up is no good, Ivanov said. He looked round wildly. We’ll have to make a stand.

Very well. There’s a chance Dexter will become visible during the fight. If that happens, you must fire the anti-memory no matter what the cost.

You won’t even have to compel me. Finishing the shit will be my pleasure.

Fletcher had put his arm protectively around a trembling Louise. He suddenly fired the anti-memory again, sending the beam over Brent’s head.

“Careful with that thing,” Brent shouted.

Fletcher ignored him. “The others are almost here.”

Three machine guns lined up on the stairwell door.

“Get away,” Ivanov told Louise, waving her towards the window at the end of the corridor. Then he saw what was behind her, and let out a fast yell of delight. “Yes! Oldest trick in the book. Fletcher, cover for me. We can get her out.” **You should have thought of this,** he accused Charlie.

There was a fire evacuation chute beside the window, a big doughnut of composite on thick swivel pinions. Ivanov

grabbed Louise and hurried her along. He pulled the release lever at the side of the chute, shoving it through a hundred and eighty degrees. The window fell out, an alarm sounded, and water rained down out of the ceiling sprinklers all along the corridor. The doughnut swung round to lock into place in front of the open window. A fabric stocking concertinaed out, the pressure it had been stored under making it pour outwards like a liquid. It fluttered away from the side of the tower as it kept on expanding, the free end sinking towards the black ground far below.

It's a manual system, Charlie protested. **The AI has no control over it.**

Louise was staring at the top of the chute in bewilderment as the cold water soaked her to the skin.

"In you go," Ivanov shouted above the alarm. "Feet first." His laugh was manic.

"No," Louise stammered. She took a frightened step backward.

A twin of the stairwell door materialized in the wall next to the original. Brent fired his machine gun straight at it. Skeletal hands with long red nails slithered up through the solid floor at his feet and clamped around his ankles. He got out one panicked shout before they tugged him down. Then all he could manage was a grunt of disbelief as his shins sank into the carpeting as though it was nothing more than quicksand.

Fletcher grabbed hold of the flailing Halo detective and exerted his own energetic power to counter the destabilising floor. Two possessed walked out of the stairwell at the far end of the corridor. They were dressed as Roman legionaries, but armed with stainless steel crossbows. The GISD agent crouched down and opened fire with his machine gun. Bursts of lightning followed the bullets through the down-pour of water. The legionaries stumbled as the bullets struck them, twanging against their bronze breastplates. But they

managed to stay upright, limbs moving in jerking motions. One raised his crossbow and fired. The bolt struck the agent on his knee, severing his lower leg. Blood foamed out of the severed limb, and he topped to one side, stunned into stupor by the pain.

Ivanov turned to Louise. “Go!” he bellowed. “Get out of here.” He shoved her roughly with one hand, and pointed the anti-memory weapon down the corridor with the other. The beam flared brightly at the advancing legionaries.

Louise gripped the rim of the doughnut, looking directly at the funnel of slippery fabric around its throat. The whole idea of jumping into it was terrifying. Another scream rang out behind her. She took hold of the handle at the top of the doughnut, and swung her legs up, pushing them through the gap. And let go.

Fletcher had got one of Brent’s legs free when three possessed rushed him out of the duplicate stairwell door. He instinctively flung his arms towards them, white fire streaming from his fingertips. They thrashed about in the slithering flame, focusing their own power to send it skidding harmlessly over their own skin.

A streamer coiled round Fletcher’s torso. He had to drop his own attack to counter it. The red slash of the anti-memory beam fluoresced the water droplets barely an inch from his nose as Ivanov tried to provide covering fire. One of the possessed collapsed.

Ivanov was switching targets when a crossbow bolt ripped into his forearm, tearing out a chillingly long strip of flesh, exposing the bone. Without muscles or tendons, the elbow joint flopped uselessly, hand opening to drop his compact machine gun. Blood gushed down to splatter the weapon’s dull metal.

When he glanced upwards, shaking the water and pain out of his eyes, he saw Fletcher writhing at the centre of five lightning forks being hurled at him by several possessed. At

his feet, a badly scorched Brent heaved down a painful breath and raised his machine gun, firing round wildly, heedless of who the bullets struck. There was no sign of Dexter. None.

He might just try and follow Louise, Charlie decided.

Ivanov was never certain who was in charge of his body at that moment. But he took two faltering steps backwards until the doughnut rim hit him just below his kidneys. Then he performed a fabulously well-coordinated back flip, and vanished head first down the chute.

Fletcher staggered to one side as Brent started shooting again. The possessed scrambled for cover, two diving through walls. Out of nowhere, a skilfully aimed ball of white fire plunged into Brent's left eye socket, and the gun fell silent. Two spears of white fire immediately resumed their strike against Fletcher. He twisted painfully under the impact, waving his hand in the general direction one of them was coming from, about to retaliate with his own fire. A thin metal band clamped tight around his throat, and an electric current punched into him. It took every reserve of strength to prevent the excruciating energy from pouring like hot acid into his brain. Thought was impossible, instinct was all he had left. He slumped to his knees, the smell of frying skin thick in his nostrils. The anti-memory weapon fell from numb fingers.

"Enough."

The current was switched off. Fletcher's muscles lost their rigor, dropping him into a twitching heap. Breath was hard to find with the unyielding circle of metal digging against his Adam's apple. His fingers scrabbled weakly against the collar.

"You just leave that alone motherfucker or I'll zap you again."

Fletcher blinked against the shower of water still gushing from the sprinklers, focusing a long pole that extended away

from the collar. At the other end was a young man, not possessed, whose tongue lolled out of the corner of his mouth. "Hands down, come on boy, down they go."

Fletcher removed his hands from the collar.

"*Gooooo* boy," the young man sneered. "Hey, Quinn, I got him for you. He been whapped but good."

Quinn Dexter materialized next to Billy-Joe. The deluge of water never even touched his robe. "Well done. I owe you at least a countess and a classical actress for this one."

Billy-Joe put his head back and howled in joy. "Yes sir. Gonna die from too much fucking."

"Shame my old friend Louise got away."

"No she ain't," Billy-Joe shouted excitably. He shoved the restraint collar's pole into the hands of a startled Frenkel, who gripped it in reflex. "I'll get her for you, Quinn. You see."

"No," Quinn said.

But Billy-Joe was already running for the evacuation chute.

"Billy-Joe!" the tone was ominous. Billy-Joe responded with a doltish grin, and dived clean through the doughnut.

"Shit!" Quinn exclaimed. He'd emphasised how much he wanted Louise Kavanagh as he led the possessed into the tower. And for all his loyalty, Billy-Joe was far too dumb to appreciate simple strategy.

Quinn couldn't chase after the girl himself. Fletcher was regarding him with calculating ferocity. Captured, but hardly subdued. And there were too many questions he had concerning the soul-less bodies now sprawled inertly along the corridor. He snapped his fingers at a couple of the possessed from the Hampstead group. "You two, get down there and help him out."

If she'd just had the time to read the instructions and pictographs on the side of the doughnut, Louise might not have been so frightened. The chute was an old idea, improved by

the use of modern flextailed fabric so it could be used from almost any height. She slid down the first four stories with little resistance; then the fabric began to constrict around her, gently braking her fall. It was designed to be elastic in one direction only, making sure its length remained constant. The end would continue to dangle one metre above the pavement no matter how many people were inside the chute.

Louise was deposited gently from the end, not even having to bend her knees when her feet touched the ground. Her neural nanonics were back on line, with the adrenaline suppression program quickly damping down her shakes. She took a few unsteady steps from the tower, then looked up. Faint sounds of conflict were drifting out of the open window far above. A bulge was descending down the chute, putting her in mind of a guinea pig swallowed by a snake.

There was no time for her to reach cover before the person in the chute arrived. Louise gave the anti-memory weapon she was holding a blank look, then aimed it at the end of the chute.

A head cleared the rim, which surprised her. She'd been expecting feet.

Ivanov had gritted his teeth against the shocking pain from his arm while his neural nanonics slowly recovered on the ride down. When he slid out of the chute the axon block was established, cutting off all the impulses from the mangled wound. Physiological shock was more difficult to counter.

With only one arm to flail around with, he tumbled awkwardly from the chute as the hem released him. Louise rushed forward to help, only to gasp when she saw the state of his bloody arm.

"No," Ivanov groaned. He rolled onto his knees, gripping the long wound tightly, trying to staunch the blood. "Go," he said earnestly.

“But you’re hurt.”

“Doesn’t matter. You go. Now.”

“I . . .” she stared round in despair at the dark deserted streets. “There’s nowhere *to go*.”

Ivanov’s expression altered, a subtle but definite change. “This is Charlie. Run, Louise. Run now. And keep on running. Go down the Holloway Road to start, there aren’t many of them in that direction. Shoot anyone you see. I mean it, don’t ask questions, just shoot. Once you’re clear, find somewhere deserted to hole up. I promise I’ll do what I can to save London. You know that, Louise.” He looked up. A bulge was sliding down the chute, already halfway down. “Now go! Please. Go on, leave. I’ll take care of them here. They won’t be following you for quite a while.”

Ivanov winked. Louise knew that was him, not Charlie. She nodded and backed off. “Thank you.” Then she was gone, running hard down the Holloway Road.

Behind her, Ivanov swung round to face the chute. He let go of his injured arm, allowing the blood to flow freely again. His good arm brought the anti-memory weapon up to point at the chute hem, just as Billy-Joe’s head popped out.

The fluorescent yellow frisbee soared high above the white sand. Haile had to formshift her tractamorphic flesh into a long tentacle to catch it. Jay clapped excitedly, hopping about. “Throw it back, throw it back,” she squealed.

Haile’s tentacle curled round the rim, and released the frisbee with a fast flick. It flew back, travelling twice as quickly as when Jay threw it, tracing a perfectly flat trajectory.

The little girl had to jump to have any chance of making a catch. It hit her hand with a sharp smack, and she tumbled over onto the sand.

“Ouch!”

You feel painfulness?

“Not half.” Jay scrambled up, shaking the tingling out of her hand. She gave the clubhouse along the beach a guilty glance. Tracy had started to warn her about the amount of times she was using the provider for medical aid when she went surfing, threatening to confiscate the board. Asking for something to ease her stinging palm would probably result in more scolding.

“Rest time,” she announced, and flopped on her towel.

Haile lumbered over and used her tractamorphic flesh to scoop out a shallow depression in the warm dry sand. She settled into it, emitting strong thoughts of grateful satisfaction.

Jay eyed the cooler box again, then looked back to the clubhouse. “What are they watching now?”

Corpus is displaying pictures from sensors on Earth for them.

“Really? Where from?”

London. Fletcher Christian has arrived to help the police locate Quinn Dexter. Tracy is concerned that the security services have acquired the life-pattern disrupter weapon.

Jay sighed with impatience. Tracy kept telling her how momentous events were back in the Confederation. Privately Jay thought the way the old observers got into such a tizz over all the political shenanigans was stupid. All she really wanted to know was when it was all going to be over and she could see her mother again. Loads of politicians arguing about who they should ally their planets with wasn't going to bring any sort of end to the crisis.

Friend Jay, what is wrong?

“I want to go home.” She hated how miserable and whiny she sounded.

Corpus asks that you be patient.

“Huh!” Suffering quickly turned to a spike of anger. “As if it cares.”

It does care, a distressed Haile said. **All Kiint care.**

“Right.” She wasn’t going to argue with Haile, it always upset both of them.

Tracy comes, Haile said with a note of hope.

Jay saw the old woman riding a chrome-blue air scooter towards them. Several of the Village residents used the little vehicles to get about on, each one as individual as its owner. Tracy’s was a fat ellipsoid shape with a recessed saddle in the middle. Stubby triangular fins with red tail lights protruded from the rear third; for show Jay assumed. There were also some positively anachronistic circular headlights on the front, like glass jewels. Tracy called it her T-bird.

Another thing Jay was banned from using by herself. She was convinced the sleek-looking vehicle could go a lot faster than Tracy’s maximum speed.

It glided silently through the air at about twenty kilometres an hour, keeping a good two metres above the ground.

Jay stood up, brushing sand from her swimsuit as the T-bird landed beside her.

“Sorry I’m late, poppet,” Tracy said. “Haile, my dear, you’ll have to look after yourself this afternoon. I’m going to take Jay to Agarn.”

“What’s Agarn?”

Tracy explained as they walked back to the chalet, the T-bird following faithfully behind. Agarn was another planet in the Arc, inhabited by a small number of Kiint. They didn’t involve themselves in the kind of life practised by the majority of the Arc, preferring more philosophical pursuits. “So mind your manners,” Tracy warned. “They’re a very dignified group.”

“Why are we going there?”

“The Agarn Kiint are slightly different from the others. I’m hoping they’ll intervene in our favour. It’s a bit of a last resort, but things are turning ugly in the Confederation. I’m worried the situation will result in a squalid kind of stale-

mate. Nothing will be resolved, which is one of the worst outcomes there can be.”

She inspected Jay’s clothes, a pair of khaki shorts and a blue T-shirt, with sturdy hiking boots. “You’ll do, quite the little explorer.”

“Why am I going with you?”

“So they can get a look at a true human.”

“Oh.” Jay didn’t like that idea at all. “Can’t they look at the pictures from the Confederation like you do?”

“In a way they already have. They haven’t turned their back on Corpus. If they had there wouldn’t be any point to visiting them.”

Jay just smiled. She still really didn’t understand Corpus.

Agarn didn’t have any buildings within sight of the teleport circle they arrived on. They were on the rolling foothills of a wide valley. It was kind of like the parkland of Riynine, but left untended for a couple of centuries. Lush emerald grass-analogue swamped the ground. Trees were twisting towers of clustered magenta bubbles. A dozen waterfalls poured over tall rock cliffs lining the valley, while every crevice was home to a stream, emptying into crater lakes that were stepped down the slopes.

Tracy looked round, dabbing at her forehead with a lace hanky. “I’d forgotten how hot it is here,” she murmured.

Jay put her sunglasses on, and they walked down to one of the crater lakes. Two Kiint were bathing just off the shore.

Hello, Fowin, Tracy said.

The Kiint raised a blunt length of tractamorphic flesh, and began to wade ashore. **Greetings to you, Tracy Dean. You are Jay Hilton? Query.**

“Yes, thank you very much. Hello.” Jay pushed her sunglasses up as the Kiint reached the shore and walked out onto the thick grass-analogue. It was very similar to Haile’s parents, though she thought the breathing vents were angled steeper, and the legs were flatter.

I thank you for this visit, Tracy said. I wish to ask you to consider intervention.

I know this. Why else do observers visit me? Following the Gebal stabilisation, every time a new species encounters a problem I am asked to be favourable towards them.

Your enlightenment is renown among Corpus.

Corpus is a constant reminder of the Gebal, so much so that I doubt my wisdom in agreeing to help. Such a notion features heavily in my contemplation. It distracts me from higher thought.

The Gebal faced a unique situation. So do humans.

Humans face an unfortunate situation.

Nonetheless, we can reach full transcendence amity. The inverse population is negligible. Our progress towards social maturity, though admittedly slow, is constant. She gestured at Jay. Please consider our potential.

Jay put on her best bright smile for the Kiint.

Your attempt to influence is crude, Tracy Dean. The child of every species is a reservoir for great potential, good and bad. I cannot judge the individual path, thus logically providing a neutral witness. However, children are inherently innocent. A positive bias.

Jay is the only human available.

Very well. The Kiint turned its big violet eyes to the little girl. What do you desire above all else, Jay Hilton?

“I want my mummy back, of course. I keep telling your Corpus that.”

So you do. I grieve with you for the loss you suffer.

“But you won’t help, will you. None of your kind will. I think that’s horrible of you. Everyone keeps saying how we’re not perfect. But do you know what Father Horst told me once?”

I do not.

“It’s very simple and very smart. If you want to know if

something is fair, then turn it round. So if you know us as well as you claim, and we were the ones with a thousand planets and providers and stuff, do you think we'd help you if we could?"

A healthy argument, presented with integrity. I know this is hard, but there are more issues involved than are apparent.

"Very clever," Jay said. She folded her arms in a huff. "I know it's possible to take possessors out of the bodies they've stolen. I saw it done. So why don't you at least help us to do that? Then we could work out what to do afterwards by ourselves. That's what you really want, isn't it? For us to stand up for ourselves."

The weapon your military is constructing requires no assistance from us.

"Not that. Father Horst exorcised Freya. He threw the possessing soul out of her."

I am interested in your claim, Jay Hilton. Corpus is unaware of the incident. Could you tell me what the circumstances were?

Jay launched into a description of the events that had taken place that fateful day in a small homestead on Lalonde's savannah. Just retelling it made her realize how much had happened since, how much she'd seen and done. It also pushed her mother further into the past, making her even more remote. She finished the story, and a tear trickled down her cheek.

Tracy's arm immediately went round her shoulders. "Hush hush, poppet. The possessed can't reach you here."

"It's not that," Jay wailed. "I can't remember what mummy looks like anymore. I'm trying, but I can't."

This at least I can remedy, Fowin said. A provider globe appeared in the air beside Jay. It extruded a square of glossy paper. Jay took it cautiously. A picture of her mother was printed on one side. Jay smiled, tears forgotten.

“That’s her passport flek image,” she said. “I remember when we went to the registry office together. How did you get this?”

It is stored in your Govcentral memory cores. We retain access.

“Thank you very much,” Jay said contritely. She looked at her mother again, warmed by the sight. “I thought you didn’t use stuff like providers on this planet, that you’d gone back to nature or something?”

Quite the opposite, Fowin said. We have rejected everything but our technology. Permanent physical structures are unessential. We are free to pursue thought alone.

“Humans are never going to evolve into anything like you,” Jay said sadly. “We’d just get too bored.”

I am glad. Your appetites are unique. Treasure them. Be yourselves.

“So will you help us expelling souls?”

I believe the circumstances that allowed Father Horst his exorcism will not be repeated on many occasions.

“How come?”

As you have demonstrated this day, human children have very strong beliefs. Freya was brought up to believe in her ethnic Christian religion. When Father Horst began the ceremony of expulsion, she believed that it would work, that the soul possessing her would be cast out. At that same time, the soul experienced doubt. It had endured a form of purgatory, implying the priests of its era enjoyed some kind of fundamental truth when they discussed spiritual matters. Now it was confronted by a priest who believed he had God’s aid to perform the exorcism. Three different, extremely strong beliefs were acting upon the soul, exerting considerable pressure not only from outside, but within its

own thoughts. The soul convinced itself of the validity of the ceremony. Its own faith turned against it, and it withdrew as it believed it had to.

“Then Father Horst can’t do it for entire planets?”

No.

“Okay,” Jay said reluctantly. She was right out of arguments and hope.

Your evaluation? Tracy asked respectfully.

I acknowledge that the breakthrough event on Lalonde was extraneous. Even so, that cannot justify total intervention.

I see.

However. Your race’s potential should be safeguarded. You may initiate a separate origin.

“Thank you,” Tracy said weakly.

“I don’t understand,” Jay complained when they returned to the chalet. “What are you so happy about? Corpus won’t intervene.”

Tracy sat in one of the deck chairs on the veranda, for once breaking her own rule and ordering a cup of tea from the provider. “You worked an absolute miracle, poppet. Fowin’s evaluation immediately becomes Corpus policy. It’s going to allow us to start a brand-new human colony if the Confederation falls apart.”

“Why is that good? The possessed won’t spread to every colony, you said that yourself.”

“I know. But it’s knowledge, you see. Humans found out about souls before they were socially advanced enough to deal with such a revelation. Now that knowledge is going to act like a mental contaminate among every culture. It’ll split humanity into a thousand squabbling factions—that’s already started with Kulu and its idea for a core-Confederation of wealthy worlds. Recovering from such a catastrophe will take generations, and even then the resolution will be influ-

enced by what's gone before. What Corpus will do is begin a colony of, say, a million people from scratch. Observers will be authorized to purchase or acquire ova and sperm stored in zero-tau from medical and biological institutes all across the Confederation. The new colony's start-up population will be gestated in exowombs and cared for by AIs during their childhood. That way, the information they're given can be carefully edited. We can start with a high-technology society equivalent to the Confederation's level of scientific knowledge and let it develop naturally."

"Fowin can do all that?"

"Any Kiint can do that. Too many of them have conformist thought routines if you ask me. At least the Agarn Kiint make an effort to push the envelope. Not that it's helped them with the Sleeping God."

"What's that?" Jay asked eagerly.

Tracy gave her a solemn smile. "Something an old race left behind a very long time ago. It's created quite a dilemma for this civilization of so-called philosophy gurus. Not that there's anything they can do to affect the situation. I think that's what upset them the most. They've been the undisputed masters of this section of the universe for so long, finding something infinitely superior to themselves is rather shocking. Perhaps that's why Fowin was so accommodating today." She stopped as Galic appeared at the foot of the veranda's steps.

"You did it," he said.

"Certainly did." Tracy grinned back.

He came up and sat in the deckchair beside her. Before long, other retired observers had dropped by to discuss the new colony. They had an enthusiasm Jay hadn't seen in them before, making them younger. Not once that whole evening did they discuss the past.

After dark, the party moved into Tracy's lounge and started calling up star charts and planetary surveys. Arguments about the merits of possible locations raged good-naturedly. Most

wanted to see the colony in the same galaxy as the Confederation, even if it had to be on the other side of the core.

Some time around midnight, Tracy realized Jay had fallen asleep on the settee. Galic picked her up and carried her into her bedroom. She never woke as he covered her with a blanket and put Prince Dell on the pillow beside her. He tiptoed out and closed the door before returning to the debate.

Louise had fled for half a mile down the Holloway Road. It was narrow at the top end, the pavements lined by tall brick buildings with crumbling windowsills and gutters. Their ground floors were small shops and cafes whose drab and grimy fronts were firmly shuttered. Her footsteps rattled off the stern walls, an auditory beacon signalling to everyone where she was.

Further down, the road began to widen out. The buildings along this section were better maintained, with clean bricks, glossy paintwork, and more prosperous businesses. Narrow side roads branched off every hundred yards or so, consisting of attractive, compact terrace houses converted into flats. Silver birches and cherry trees in their front gardens overhung the pavements, to give them the semblance of a quiet rural town.

The slope began to flatten out, revealing at least a mile of straight deserted road ahead of her. The larger commercial premises had taken over on either side, their hologram adverts swirling over the broad pavements, forming a skittering iridescent rainbow. Traffic control informationals hung in the air above road lanes at the main junctions, flashing their colour sequences down onto the empty carbon-concrete.

Louise slowed to a halt, panting heavily from the exertion. She couldn't see anything move behind her, but it was so dark behind her she'd hardly see any pursuers until they were almost on top of her. Travelling on under the illumination of the holograms would be a mistake.

Tollington Way was fifty yards ahead of her, a side road leading into the backstreet maze that proliferated behind every major London thoroughfare. Holding her sides against the ache of breathing, Louise jogged for a hundred yards down it, then stopped and hunched down in the deep shadows of a doorway.

Her soaking leggings were chafing her thighs, the T-shirt was disgustingly cold and clammy, and her feet felt as though they were shrivelling up. She was shuddering all over now from the cold. High above, small green lights flashed on the dome's geodesic structure.

"Now what?" she gasped up at it. Charlie would be watching her through the sensors, seeing her infrared image constricted into a small ball. She datavised a general net access request. There was no response.

Escape and hide, Charlie had told her. Easy to say. But where? No one was going to open their door to a stranger on this night. She'd probably be shot just for knocking and asking.

A cat yowled and jumped off a nearby wall to run along the street. Louise was rolling to the ground and bringing the anti-memory weapon smoothly to bear before the noise had even registered properly. The cat, a furry tabby, loped past, giving her a disdainful look.

She let out a brief sob as her muscles went limp. The weapons control program was still in primary mode. She took it off line as she climbed painfully to her feet, swatting dirt from her knees and the front of her waistcoat.

The cat was still visible, silhouetted against the hologram haze curtaining the end of Tollington Way, its tail swishing about arrogantly. It was obvious she was still too close to Holloway Road; her pursuers would come down it, searching every side road. Fletcher said they could sense people without even having to see them.

Louise accessed the map of central London she'd stored

in a neural nanonics memory cell, and began to walk away from the light. The anti-memory weapon was slipped back into her waistcoat pocket. She couldn't work out which was the better way of avoiding search parties; staying in one place (assuming she could find a disused room or warehouse) or constantly moving round. The odds were uncomputable, principally because she didn't know what she was facing. An organized systematic hunt, or a couple of possessed ambling round in a disinterested fashion.

Studying the map was almost meaningless, it didn't relate to anything. Without any goal, any destination, one street was the same as any other. Its only use was in preventing her from crossing any of the main roads.

Maybe I should just find somewhere to hide. That's what Charlie suggested.

On an impulse she called up the Ritz's address. The map had to switch magnification factors the hotel was so far away from her.

That was out, then. Pity, no one would think to hunt for her there.

"Andy," she whispered in shock. The one person she knew in London. And who would never turn her away.

She retrieved his address and ran it through the London directory she'd loaded along with all the other junk data recommended as essential personal survival tools for the arcology. Some people didn't include their physical address with their net code. But Andy had. He lived in Islington, somewhere on Halton Road. A tiny blue star burned on the map.

Two miles away.

"Sweet Jesus, please let him be there."

They chained Fletcher to the altar with manacles that had an electric current running through them, nullifying his energetic power. They ripped his clothes off, and cut obscene runes into his flesh. They shaved him. They burned a pile of

Bibles and prayer books at his feet, and used the ash to smear a pentagon around his body. They hung an inverted cross above his skull, dangling by a rope that was fraying and rotting.

Ghosts slithered past, offering their desolate expressions in sympathy.

“Sorry,” was their only whisper. “So sorry.” Past heroes, humbled and degraded by their emasculation. The possessed spat at them, jeering them out of the way.

St Paul’s was illuminated with the mealy light from smoking iron braziers and racks of candles, leaving the vaulting ceiling invisible. Its new incense was the smell of sweaty bodies and fried burgerbap onions. Prayers had been supplanted by rock music coming from a ghetto blaster, with the sounds of copulation heard between tracks. With his head forced back awkwardly against the stone, Fletcher could see several young possessed scrambling monkey-fashion over the stained glass windows, painting them over with sticky black fluid. A dark shape moved into his limited field of view.

Quinn bent over him. “Nice to see you again.”

“Enjoy your taunts while you can, you inhuman monster. You will issue them no longer once this day is through.”

“You’re good. I admire that. You got off Norfolk in time, which wasn’t easy. And you got down to Earth, which is fucking impossible. Very good. What did you do? Make a deal with the supercops?”

“I know naught of what you speak.”

“Shit. Okay, I’ll put it in real slow retard-speak for you. Who brought you down to Earth?”

When Fletcher didn’t answer, Quinn ran his hand over the iron band securing the man’s forehead. “I can have them increase the voltage you know. It can get a lot lot worse.”

“Only while I remain in this body.”

“Not such a dumb asshole after all.” Quinn crawled sinu-

ously onto the altar beside Fletcher and moved his hooded head right up close. "Before we go any further," he whispered, "what's she like to fuck? Come on, you can tell me. Is she hot stuff? Or does she just lie there and take it like a corpse? Just between us. I won't tell anyone. Does she give good head? Does she like it up the ass?"

"You are unfit to live, sir. I shall relish your fall, for it will be a great one from the height of your arrogance."

"Don't tell me you never tried her out? That Louise? She was with you for weeks and weeks. All that time. You must have." Quinn withdrew a fraction, vaguely puzzled. "Shit, you're the one that's not human."

"Your judgements have neither value nor relevance to me."

"Oh yeah? There's one judgement I might interest you in. I'm gonna find out what she's like. My people will bring her here for me, and then you can watch me and Courtney go to work on her. I'll make you watch. See how long you can keep that *assholing* superiority going then. Motherfucker!"

"You will have to find her first."

"Oh I will. Believe it. Even if the morons I've got out there now don't do it, His army will bring her to me. And then that last little thread of defiance you treasure will snap. You'll scream and plead and cry, and curse your shitty false Lord for his divine inaction."

"The Lord moves in mysterious ways His wonders to perform. The age of miracles may be past, but His messengers still walk amongst us. You *will* fail. It is written."

"Bollocks. There are no messengers. And I'm busy burning the book it's written in. It's my Lord who comes, not yours. And He doesn't move mysteriously. God's Brother is very blunt, as you're going to find out. Unless I spare you."

"I would never be sullied by your mercy, sir."

"No? Then how about sparing Louise? Join us. Get on the

winning side. I'll give her straight back to you. Won't touch a hair on her head. Promise. And that's a lot of hair."

Fletcher gave a short, bitter laugh.

"I mean it," Quinn said smoothly. "You're smart, tough. I could use people like you. You were some sort of officer, right? Half these shitbrains I've got working for me can't find their own ass with both hands. I could put you in charge of a whole bunch of them. You can make out any way you like, then. Marry Louise. Live in a palace. It can't get any better."

"I apologize, for I am mistaken. I had thought you dangerous. I see now you are merely small. Our Lord Jesus was offered the kingdoms of the world, and refused. I believe I can resist coveting another man's wife and some fine living. Have you not yet learned that in this wretched state we can create anything we desire for ourselves? You can offer nothing of any value; you may only rain down empty threats."

"Empty!" Quinn shouted in rage. "He *is* coming. *My* Lord, not yours. If you don't believe me, ask the ghosts. They can hear the dark angels draw near. His Night will fall. That is the new miracle."

"Day follows night, as it is now and always will be. Amen."

Quinn backed off the altar and stood up. He held an anti-memory weapon in front of Fletcher's face. "Okay, fun-time's over, dickhead; tell me what this is."

"I do not know, sir."

"You were shooting it about pretty freely before. Was it meant for me? Is that why the supercops let you down here? Were you trying to find me for them?" Quinn beckoned.

Frenkel stepped forwards and dumped Billy-Joe's body on the altar next to Fletcher. The young man's head flopped about. His eyes were open, unfocused, and he was still breathing.

"We found him like this down at the bottom of the Arch-

way tower. The big black dude managed to shoot him with one of these gadgets before my troops took him out. Now, I can understand a weapon that forces possessors out of their host body. Every fucking scientist in the Confederation must be working on that right now. But this is a little more powerful, isn't it? Billy-Joe wasn't a possessed, but it still kicked his soul's ass out of there." Quinn smiled, fangs pressing up into white lips as he sensed the worry trickle into Fletcher's thoughts. "Or did it do more than that? Huh? Those supercops play for the highest stakes there are. They know I can just come back in another body and start the whole crusade up again. Because I can't die, now can I? We're all immortal now."

Fletcher's face became a mask of stubborn determination.

"Ah," Quinn said softly. He held the weapon up, regarding it with a new respect. "Let's try a little experiment, shall we?" His hand made a pass over Billy-Joe, applying energetic force to open a pathway to the beyond. A soul struggled its way up into Billy-Joe's body. He sat up, wheezing for breath, looking round avidly.

"How about that?" Quinn marvelled. "No strain, no pain. We can speed up the whole resurrection game." He grinned down at Fletcher. "You know what, in the wrong hands this little toy you brought me could be really dangerous."

The tenement on Halton Road consisted of three low-cost apartment towers intended for the poor and the elderly. A third of the residents still fell into that category, the rest worked in the black cash economy or lived off the dole, spending their days stizzed out on cheap activant programs and home-synthesised drugs. There were no other amenities for them. The ground between the twenty-storey towers was a concrete yard walled in by rows of small garages. Fading white lines marked out baseball and football pitches, though the baskets and goal posts had been

torn out of the ground decades ago. Despite its classical urban erosion demeanour, it was a perfect site for The Disco At The End Of The World.

Andy had been dancing on the worn concrete since sundown, embracing the communal madness. Out of all London's residents, the type that lived in the tenement had the least to lose when the possessed came marching out of the darkness. So . . . sod it. If you are absolutely going to get captured by the evil dead/tortured/your body consumed by ghouls/live the rest of eternity as a zombie slave, you might as well have one last decent party before it happens.

The underground trax jammers had set up their ageing speaker stacks as twilight fell. When the sun left the sky, out came the pounding rhythm to rattle the windows and sneer an utterly worthless defiance at the arcology's new overlords. Everyone had dressed for it. That's what Andy loved. Disco divas in their sequined micro dresses, hot funk dancers in leather and infra-white shirts, jive masters in sharp suits. All grooving and swaying in one huge dense mass of hot bodies, doing the stupid moves to stupid old songs.

Andy wriggled his hips, and waved his hands, and generally boogied on down like he'd never done before. No need to be self-conscious now, there wouldn't be a tomorrow morning for people to laugh at him and his coordination. He swigged from the bottles passed round. He snogged a couple of girls. He sang along at the top of his voice. He made up his own cool moves. He cheered and laughed and wanted to know why the hell he'd wasted his life.

And then there she was. Louise, standing in front of him. Clothes wet and dishevelled. Her beautiful face deathly serious.

She'd generated her own space among the exuberant dancers. People instinctively avoided her, knowing that whatever private hell she was in they didn't want any part of it.

Her lips parted, shouting something at him.

“What?” he yelled back. The music was incredibly loud. She mouthed: Help.

He took her hand and led her across the yard. Through the ring of elderly people around the edge of the dancing throng, happily clapping along and doing a small shuffle. Into the brick-wall lobby, and up the stone stairs to his flat.

When the door shut behind them, Andy thought he was dreaming, because Louise was in his flat. Louise! On the last night of existence, they were together.

His window looked out over the street not the yard, so the music was muted down to a constant bass drumming. He reached for a lightstick; the grid power supply had failed early that morning.

“Don’t,” Louise said.

Without air conditioning, condensation had settled thickly on the glass panes, but there was enough coloured light from the disco creeping in to reveal the outline of the small room. A bed at one end, sheets unwashed for a while now. Apart from one vinyl-top table littered with electronic tools, the furniture was cardboard boxes. The kitchen fitted into an arched alcove with a plastic curtain drawn across it.

Andy hoped she wouldn’t look at it all too closely. Even in this light it was seedy. His delight at seeing her was fading as his real life began to seep back to claim him.

“Is this the bathroom?” she asked, indicating the one other door. “I got drenched. I’m still cold.”

“Um, sorry, it’s supposed to be the bedroom. I just use it to keep stuff in. Bathroom’s down the hall. I’ll show you.”

“No.” Louise stepped up to him and put her arms round him, nestling her head against his. He was so startled he didn’t respond for a couple of seconds, then he gingerly returned the hug.

“There’s been so much horror in my life today,” she said. “So many vile things. I’ve been so frightened. I came here to

you because I have to. There's no one else left for me now. But I want to be with you as well. Do you understand that?"

"Not really. What's happened to you?"

"It doesn't matter. I'm still me. For now." She kissed him, urgency arousing her in a way she hadn't experienced before. The desperate need to be held, and adored, to be promised that the whole world was a fine and good place after all.

She demanded all that from Andy on his small disorderly bed. Spending the night being worshiped, listening to his ecstatic cries twist away into the disco music while the hazy dapple of iridescent light played across the ceiling. Air in the small confined room grew stifling from the heat and sweat evaporating off their skin. It made them oblivious to the Westminster dome's giant air circulation systems shutting down.

By the time the first tendrils of thin mist were rising from the Thames to squat listlessly above the riverside buildings, their bursts of orgasmic pleasure had become close to pain as program abuse forced already overdriven flesh to continue. Finally, with the exquisite narcotic of desperation spent, they clung to each other, too senseless to know that a thin layer of cloud had started glowing red above the heart of the ancient city outside.

26

Liol piloted *Lady Mac* right up to the big spacedock globe on the diskcity rim where the MSV was parked, locking position twenty metres outside the yawning hatch. Joshua was very insistent they didn't come inside.

Working out a procedure for bringing Quantook-LOU and five of his entourage inside the starship had taken up the entire trip from the transparent bubble to the rim airlock hatch. They eventually agreed that two of Joshua's crew, Quantook-LOU, and another Mosdva would ride the MSV out to the starship first. There would be three shuttle flights in all, and Joshua would be the last over. That way the distributor of resources would be satisfied that the starship wouldn't fly away as soon as its captain was on board, leaving him behind. The idea that Joshua, as commander, wouldn't desert any crew was obviously foreign to him. An interesting outlook, the humans agreed, and a good marker for future behaviour.

The xenocs were assigned the lower lounge in capsule D, which had its own bio-isolation environmental circuit. Sarha modified it to provide a mix of gas to match Tojolt-HI's at-

mosphere, not that they carried a great deal of argon, and she had to omit the hydrocarbons altogether.

Once Quantook-LOU was inside and Joshua was back on the bridge, the Mosdva would provide the coordinates of their destination.

Mosdva spacesuits were made from a tight-fitting fabric and woven with heat regulator ducts. Only the upper two sets of limbs were given sleeves, the lower legs were tucked up next to the body, making the lower section look as if it was the end of a giant stocking. The helmet was chunky, with internal mechanisms bulging up like warts and a forward glass visor that had several protective slide-down shields. Their life-support backpack was a cone whose tip flared out into a fringe of small jet-black fins. A single, thick armoured cable linked it to the helmet. An oversuit web carried electronic modules and canisters the same way as their torso jackets.

Beaulieu and Ashly watched the xenocs through a ceiling sensor as they came through the connecting airlock into the lounge. They didn't move with quite the same ease as they did back in the diskcity, lacking the fronds to give them stability. But they were adapting fast to grab hoops and the inter-deck ladders.

When the last one was inside, Ashly closed the hatch and let the new atmosphere in. Quantook-LOU waited in the middle of the lounge, while the others conducted a detailed examination. Most of the fittings had been stripped out for this flight anyway, leaving a spartan cabin. It didn't leave them much technology to probe, and there was certainly nothing critical they could damage. The Mosdva satisfied themselves that the lounge wasn't actively hostile, and confirmed the atmosphere was compatible before removing their suits. They quickly transferred the electronic modules from their oversuits to their usual jackets.

Beaulieu had used a neutrino-scattering detector when they were in *Lady Mac's* airlock to scan the hardware they'd

brought with them. Alkad and Peter joined her in analysing the function of various components. They were carrying small cylinders of chemical explosive, lasers, spooled diamond wire, and a gadget which Alkad and Peter thought would give off a powerful EM pulse. The internal molecular binding force generators could maintain the lounge decking's integrity against any of their weapons should they get hostile.

More interesting were the number of implants each of them was loaded with. The central nervous column, running through the centre of the body, had a number of attachments spliced into it, artificial fibres spread out through the tissue to form a secondary nervous system. Biochemical devices were grafted on to glands and circulatory networks, supplementing organ functions. Compact weapons cylinders were buried in limb muscles.

"The weapons I can understand," Ruben said when Beaulieu displayed the images over the general communication link. "But the rest seem redundant. Perhaps their organs still haven't fully evolved to freefall conditions."

"I disagree," Cacus said. "Quantook-LOU doesn't have the same degree of enhancements as the other five. I'd say his escort are the Mosdva equivalent of our boosted mercenaries. They'll be able to keep functioning even when they're badly damaged."

"It's probably significant that Quantook-LOU's physiological condition is generally superior to the others'," Parker said. "His bone structure is certainly thicker, and from what we can understand of his internal organs their biochemical functions have a higher degree of efficiency. That suggests to me that he was actually bred. Fifteen thousand years isn't long enough for a full genetic evolutionary adaptation to freefall, there are just too many changes from a gravity environment to incorporate."

"If you're right, that would confirm an aristocracy-based

social structure,” Cacus said. “Their whole administration class would be an elite.”

“He does have a large amount of processors hardwired into what passes for his cortex,” Oski said. “A lot more than the soldiers. They augment his memory and analytical abilities to a similar level as neural nanonics.”

“Physical and mental superiority,” Liol said. “That’s very fascist.”

“Only in human terms,” Ruben chided. “Imposing our values on xenocs and then going on to judge them is the height of conceit.”

“Pardon me,” Liol mumbled. He checked round the bridge to find Ashly and Dahybi grinning at the Edenist’s snobbery; Sarha gave him a thumbs up.

“An aristocracy is historically arrogant,” Syrinx said. “If all the dominions are structured the same way, it would explain why they are so quick to escalate their disagreements into war. The administration class would regard the soldiers as expendable. Like everything else here, they are resources to be exploited to the advantage of the dominion.”

“Then where exactly do we fit into their neat little hierarchy?” Sarha asked.

“What we have is valuable to them,” Parker said. “What we are, is not. They will deal with us on that level only.”

Joshua slid through the lower deck hatch into the bridge, and settled onto his acceleration couch. He datavised the flight computer for a systems review, and took over the command functions from Liol. “We’re ready,” he told Quantook-LOU. “Please give us the location.”

One of the Mosdva’s electronic modules transmitted a stream of data.

“That’s one of the tangles in the web, nine hundred kilometres away,” Beaulieu said. She datavised a string of instructions to the ELINT satellites, using the closest one to give the section a close scan. “The knot itself is approxi-

mately four kilometres across, rising seventeen hundred metres above the disk's median level. A lot of infrared seepage in the surrounding area. Most of the knot's web tubes are dead. The thermal exchange mechanisms around it are still functioning, but with a reduced output."

"Somebody's still alive there," Sarha said.

"Looks that way."

"We have the position," Joshua told Quantook-LOU. "What kind of acceleration can you withstand?"

There was a slight pause. "Thirty per cent of the acceleration you used when you approached Anthi-CL would be acceptable to us," Quantook-LOU said.

"Understood. Secure yourselves, please." Joshua extended *Lady Mac's* combat sensors and ordered the standard booms to retract. The crew went to combat alert status. A quick check of the lounge sensors showed the six Mosdva prone on the cushion padding which Beaulieu and Dahybi had laid out for them on the decking.

It wasn't worth igniting the fusion tubes. Joshua used the secondary drive to accelerate the starship at a tenth of a gee. The vector he'd plotted took them out a hundred kilometres from the sunside, then curved across towards the knot.

"Gas plumes on this side as well," Beaulieu warned. "They're still fighting down there."

Joshua called Quantook-LOU. "We can see there's still a lot of conflict on Tojolt-HI. It would help to know if we are likely to be attacked, and by what."

"No Tojolt-HI dominion will attack this ship unless it appears you are leaving. If I have not secured your drive technology, then our desperation will increase."

"What form will an attack against us take? Do you have ships that can intercept us?"

"We have no ships other than the sunscoops which you have already seen. Energy-beam weapons will be used to damage you. I would speculate that many dominions will be construct-

ing fast automated vehicles. The speed which the *Lady Macbeth* can travel at has been studied. They will be swifter."

Joshua looked round the bridge. "I'd say we don't need to worry about missiles. It's the lasers that trouble me. The dominions have the kind of power generation capacity which makes our SD platforms look feeble."

"But not on this side of the diskcity," Beaulieu said. "Sensor scans have dropped considerably since we moved across the rim. Ninety per cent of their systems are mounted on the darkside."

"They can poke a laser through the foil quick enough," Liol said.

"We'll be watching for it," Sarha told him.

"I'd still like to understand the circumstances," Joshua said. "Quantook-LOU, can you tell me which dominions are allied with Anthi-CL?"

"Outside our main alliance quartet, there is no longer any way of knowing. Your arrival has disrupted the dominions at every level. The rim dominions search for allies among the centre. The centre dominions struggle among themselves as the old alliances fall to be replaced by lies and unkeepable promises."

"And we did all that?"

"For all our history, resources have been finite, and our society reflects this. Now you have come, and every resource has suddenly become infinite. There can only be one dominion now."

"How so?"

"We are in balance. The central dominions have larger areas than those of the rim, but the rim is where the new mass gathered by the sunscoop ships is distributed from. Our value is therefore equal. Each rim dominion supplies its centrist allies with mass, and the amount of mass which can be delivered is obviously dependant on the number of sunscoops. The number of sunscoop ships which can be built is

dependant on the size of the alliance. Their construction absorbs a fearsome quantity of our resources. When a sunscoop fails to return, the quantity of mass available to the alliance is reduced, causing shortages and hardship among the dominions. Then the alliance grows weak as dominions struggle against each other to obtain the level of mass they require. That is when the distributors in each dominion move to forge new alliances that will allow them to regain their old level of supply.”

“I understand,” Joshua said. “With our technology allowing you to bring new mass in from other star systems, the sunscoops will not be able to compete. Every central Tojolt-HI dominion will turn to Anthi-CL to supply them with mass, becoming your allies. Without a market, the other rim dominions will fail, and also be incorporated into the alliance.”

“And I will be the distributor of resources for all of Tojolt-HI.”

“Then why are the other dominions fighting you?”

Quantook-LOU raised his mid limbs a small distance against the gee force, slapping his torso feebly. “Because I do not yet have your drive technology. As always they search for advantage. By reducing Anthi-CL to ruin, they will deprive me of the resources to build starships. You will be forced to make the exchange with them.”

“But you said the alliances between the central dominions are unstable.”

“They are. The other distributors are greedy fools. They would destroy us all. The damage they have already caused to Tojolt-HI is on a scale we have never endured before. It will take decades to repair everything.”

“So just tell them you have our drive. I’ll back you up. We can work out the details of the exchange later. That will stop the destruction.”

“Anthi-CL’s allies know I have not yet acquired your starship drive. I maintain our primary alliance with the quartet

by assuring them that this venture to acquire astronomical data will result in triumph. In turn, they barter this information to gain advantage should I fail. All of Tojolt-HI knows you have not yet exchanged the data with me. They watch to see the outcome of this flight. Once I can signal Anthi-CL that I have the data to build your drive, our quartet alliance will solidify once more. The other dominions will have no choice but to join with us. Faster-than-light travel has made our unification inevitable. All of us know this. All that remains is the question of who shall become distributor of resources for Tojolt-HI. If it is not me, then it will be another dominion's distributor. That is why they will attack should you attempt to fly away."

Joshua switched off the link to the lounge. "Opinions?"

"He's very good," Samuel said. "I think he's realized you have a conscience, or at least some kind of ethical code. That's why our arrival is blamed as the cause of the diskcity war. We're also under threat not to try and leave, otherwise we'll be shot. Everything he says is to his advantage."

"The economic structure of Tojolt-HI certainly made sense," Parker said. "That lends credence to the rest of the situation."

"It's certainly favourable for us," Liol said. "Even if Quantook-LOU is exaggerating the political instability, everyone here wants to be the one who gets ZTT from us. They're prepared to go to war in order to give us what we want."

"Pity we can't use that to negotiate some kind of peace settlement," Syrinx said. "I can't help but feel very uncomfortable about this."

"We could simply beam the information across Tojolt-HI after we get a copy of the Tyrathca almanac," Beaulieu suggested. "Even if Quantook-LOU does get us the almanac data, and we give him ZTT technology, the physical aspect of their conflict will probably continue as the consolidation into one dominion moves forward."

“The irony of all this astounds me,” Ruben said.

“I fail to see how,” Syrinx replied quickly. “You must have a very black sense of humour to find this remotely funny.”

“I never said funny. But don’t you see what this discussion mirrors? This is how the Kiint must have debated our species when we asked them for the solution to the beyond. To the Mosdva, faster-than-light travel is obviously the answer to all their problems; they can have an infinite supply of mass, they can begin fresh colonies, and they can exterminate their old oppressors. To them it is essential we supply it, and they are willing to risk everything to gain what we have. Yet for us, with our complete understanding of ZTT, giving them the technology means releasing a genocidal crusade across this whole section of the galaxy, as well as the possibility of the Confederation going to war against them at some time in the future. Which we would probably lose, given their numbers.”

“If the Tyrathca don’t get us first,” Monica muttered out loud.

“Are you saying we shouldn’t give them ZTT?” Joshua asked.

“Think what will happen if we do.”

“We’ve been through this already. The Mosdva will probably get faster-than-light travel anyway, now they know it’s possible.”

“Just as the Kiint keep saying we have to find our own solution to the souls in the beyond now we know it exists.”

“Jesus! What do you want me to do?”

“Nothing now. We were right before: the question is one of timing. I think we got the answer wrong.”

“Maybe we did,” Syrinx said. “Though I’m not convinced. But this has made our future actions very clear cut. We have got to solve the problem of possession and the beyond first. Only then will we be in a position to deal with the

whole Tyrathca/Mosdva issue. And the only way we can do that now is get to the Sleeping God.”

The ELINT satellites continued to show the war across Tojolt-HI’s darkside. Blowouts were occurring with increasing frequency, sending long spumes of vapour and fluid racing out into space, propelling bodies along with them. Mosdva troops in armoured spacesuits continued to scurry across the valleys and ridges of the darkside structure. Almost all train movement had ceased.

The heaviest fighting was conducted around the boundary of Anthi-CL and its neighbouring allies. As well as the blowouts decompressing entire tubes, suited Mosdva shot at each other with beam and projectile weapons as they struggled to penetrate their enemy’s territory and disable critical systems. The satellites were also picking up powerful flashes of energy among the tall thermal dissipation towers as emplaced defensive lasers and masers swept across the ranks of advancing soldiers.

“But no nukes,” Beaulieu said. “At least not yet. I have picked up some small short-range missiles, but they use chemical rockets and warheads. They’re not very successful; the lasers usually pick them off. Hardly surprising, the maximum acceleration so far has been seven gees.”

“I wonder why they use chemical systems?” Monica asked. “One well-placed nuke would take out a whole dominion. They must have the ability to build them. Quantook-LOU said they used to move asteroids around with them, just like we do.”

“We can ask Quantook-LOU if you like,” Joshua said.

“I’d rather not,” Samuel said. “I’d hate to put ideas in his head. In any case, you’re misrepresenting the nature of conflict here. Everything is resource-based, even war. The aim must always be to kill an enemy’s population, but keep their web tubes intact. Explosive decompression will have exactly that result every time, giving the victorious dominion

room to expand. A nuclear strike would obliterate a vast amount of the diskcity structure, while the shockwave would weaken even more.”

“Okay, so they use neutron bombs,” Liol said. “Kill the population and leave the structural mass intact.”

“I definitely wouldn’t mention that to Quantook-LOU.”

Etchells expanded his distortion field to scan around as soon as he slipped out of the wormhole terminus seventy-five million kilometres above the surface of Mastrit-PJ’s photosphere. Thermo dump panels slid out to their full length from every life-support capsule and subsidiary system to get rid of the heat. Electronic sensor pods opened their petal segments, extending antenna.

Red light flooded across the utilitarian bridge compartment, cutting through the heavy shielding of the main port. Kiera blinked away the rush of liquid it brought to her eyes as she sat on the acceleration couch facing it. She was content just to admire the genuine panorama, ignoring the various graphic displays that oscillated and scrolled across the consoles as they tabulated the results of the sensor sweeps.

“Nice view, if a little characterless,” she said. A pair of sunglasses appeared in her hands, and she placed them carefully on her nose. “Can you sense anything nearby?”

“Nothing,” Etchells said. “Which means nothing. Searching an entire star system is impossible for a single craft. Assuming they even came here.”

“Nonsense. They’re here. It’s the only place they could be. This damn star has been glaring at us ever since we rounded the nebula. This is where the Tyrathca came from, and it’s where that arkship came from. They have to be here, along with whatever it is they’re looking for.”

“Yes, but where, exactly?”

“That’s your department. Keep your sensors extended. Find them. When you do, I’ll keep my part of the bargain.”

“The odds are not in our favour.”

“The fact that any odds exist at all is in our favour. If there is anything left of the Tyrathca here, it must be on a planet or asteroid. You should start a survey.”

“Thank you. I’d never have thought of that.”

Kiera didn’t even bother sighing a reprimand. He could perceive her mental tone as well as she could feel his. It wasn’t that they’d been getting on each other’s nerves during the voyage, just that they weren’t natural allies. “Can you withstand the temperature?”

“Provisionally, yes,” Etchells said. “Though the particle density will have to be monitored as closely as the thermal input. The technological systems can cope with the heat; as can my hull. I estimate we can endure this environment for three days, then we will have to swallow away and cool off.”

“Okay.” She stood up and stretched elaborately. There had been too many hours spent sitting uselessly on the bridge during the flight. It gave her too much time to brood over what had gone wrong back on Monterey, when what she ought to be doing was planning how to use the weapon which the Confederation was chasing. “I’m going for a shower. Let me know when you find something.”

Beaulieu used a full-spectrum sweep against the sunside surface as *Lady Mac* decelerated into the coordinate Quantook-LOU had provided. The web tubes and their foil sheets matched the rest of Tojolt-HI’s sunside in composition, but here they had risen out of the median in a small hemispherical mound, which matched the bulge on the darkside.

“The knot is about three kilometres across, nine hundred metres high, and I can’t even begin to tell you what’s inside,” Beaulieu said. “Nearly eighty per cent of the knot and its surrounding webs are dead. Surface glass is cracked, and some structural ridges snapped. But that still leaves enough mass to shield the internal structure from all our sensors.”

“Don’t like it,” Liol said. “That’s over ten cubic kilometres we don’t know a damn thing about. They could be hiding anything in there.”

“Nothing that’s used very regularly,” Ashly said.

“Yeah, like their biggest-ever weapon.”

“Electrical and magnetic fields are normal,” Beaulieu said. “I’m not registering any large power sources on either side of the disk.”

“Not active ones. The energy for a blast would be stored ready.”

“Ready for what?” Sarha asked.

“I don’t know. We haven’t explored one per cent of this star system, we don’t know what else is lurking around here. Fleets of refugees from other diskcities. Xenocs that live inside the Orion Nebula. Mosdva possessed.”

“Oh, come *on*.”

“Point taken,” Joshua said. “We need to be cautious.”

“The *Oenone* can swallow in,” Syrinx said. “Our distortion field will be able to probe the interior of the knot.”

“No,” Joshua said. “I still don’t think we’re ready to give away our biggest advantage yet. Beaulieu, I want constant monitoring of the knot. Any change in its energy state and we jump clear. In the meantime, let’s see what Quantook-LOU’s prepared to tell us.” Before he asked, Joshua cleared the overlay of ship schematics from the sensor image. Tojolt-HI had been bothering him, niggling away for a while now. It wasn’t worry about what they were heading into, he acknowledged, it was the size of the diskcity. He’d been appropriately amazed and impressed with it ever since the sensors had delivered their first image to him. This was different, because their little flight had suddenly put it into perspective for him. They were flying over it, an artefact which was so densely populated it made an arcology appear vacant. Human bitek habitats were fabulous huge entities, but you

didn't fly *across* them in a spaceship, not for minutes at a time. And they weren't even halfway to the centre yet.

The visual spectrum sensors showed him a tiny black spot trawling over the burnished sparkle of the glass and foil which made up sunside. *Lady Mac*'s shadow, smaller than the width of most web tubes. Many times he'd seen Ganymede's shadow racing over Jupiter's dayside clouds, a black blemish smaller than the planet's cyclone swirls. A moon big enough to qualify as a planet, reduced to its true insignificance by the magnificent gas giant. This was exactly the same.

"We're going to be at your designated location in a couple of minutes," Joshua told Quantook-LOU. "I'd like to discuss the terms of the data exchange. After all, neither of us wants this deal to fall apart now."

"I agree," Quantook-LOU said. "I will take my escort into this section of Tojolt-HI and secure the information you require. As before, you will be given the indices of the files. If you are agreeable that it is what you want, we will perform a synchronized exchange of our respective information. You will then leave Mastrit-PJ immediately."

"Fine by me, but won't you be in danger? This is a long way from Anthi-CL, we can return you."

"After the exchange I will be the only member of my race to have the information. That makes me more valuable than the sun's mass in iron. Nobody will harm me. If I was to return to the *Lady Macbeth*, what guarantee could you give me that you would not simply fly off back to your Confederation, thus removing the knowledge from my race?"

"I would not be able to offer a guarantee that would satisfy you, Quantook-LOU. However, I know nothing of Tojolt-HI. I do not know what is contained within this section behind the web tubes. How do I know that it is not some powerful weapon that can destroy my ship as soon as you have the information you want?"

“This is an old section, its dominion has almost collapsed. Do your sensors not show you that it poses no threat?”

“There is nothing we can see on the surface, but I must know what is inside. I propose to send two of my crew members with you. They will only observe, they will not interfere with your activities.”

“I accept.”

Joshua ended the link. “Ione, you’re on.”

Lady Mac closed slowly on the sunside surface, using ion thrusters to manoeuvre in towards the approximate boundary of the knot. The web tubes below the starship were dead, as Quantook-LOU had requested. He had also asked that Joshua provide a method of crossing the gulf. As a result, the two suited and armoured serjeants were waiting in the open EVA airlock, ready to jet across and secure a tether to the tube surface.

Ione watched the long arched segments of glass grow larger; nothing was visible below the tarnished and pitted surface. Her armour suit sensors could just make out the faint lines of the inner spiral of piping. *Lady Mac*’s shadow was expanding and darkening over the glass and foil sheeting as the starship slid inwards. She saw a flickering motion sweep across the darkened glass. A multitude of anfractuous cracks spread out from the rim of the segment as though tendrils of frost were gripping the tube.

“It’s rupturing,” she told the crew.

“Thermal stress,” Liol replied. “It’s our shadow that’s causing it. Don’t forget, that material has never had its heat input interrupted before.”

“Ione,” Joshua said. “I’m locking our attitude . . . mark. You can go over whenever you’re ready.”

The curving glass was seventy metres away from the airlock hatch. The first serjeant disconnected its safety line from the chamber socket and activated the manoeuvring pack.

Attaching the end of the tether was no problem. The

cracked glass had come out of the rim of the metal reinforcement hoop, leaving a gap she could loop it through. Once it was done, she moved aside. Joshua wanted the Mosdva to cut their own way in.

The xenocs hauled themselves along the tether using the powered gauntlets they wore on their midlimb hands. There was no subtlety in their entry. One of them simply used a laser to slice a circle through the glass and the piping underneath.

Ione was last in, both serjeants following one of the bodyguard Mosdva. She thought it must have been a long time since the tube was inhabited. The fronds had petrified, then ablated away in the vacuum, leaving a cloud of granular dust clogging the tube. Even with that, it was a lot brighter than the sections they'd toured in Anthi-CL. Without the fluid to shield the interior, the light from the sun was fearsome.

The Mosdva made their way purposefully along to the end of the tube. They used the tarnished plant apertures as grips, which afforded them almost the same degree of mobility as the fronds in a pressurized tube. Ione simply used the manoeuvring packs.

When they reached the end of the tube, one of the bodyguards cut through the airlock hatch with a laser. They moved through the junction and into another tube on the other side, heading into the knot.

As soon as the last serjeant was inside, Joshua used the chemical vernier thrusters to back them away from the sun-side surface. Beaulieu reported that nine small satellites had taken off from across Tojolt-HI. All of them were emitting low-power radar pulses, tracking *Lady Mac*.

"It looks like Quantook-LOU is heading for the apex of the knot," Samuel said. "So far he's staying with the surface tubes."

"I'm analysing the signals the serjeants' electronic warfare blocks are picking up," Oski said. "The Mosdva are trans-

mitting a lot of pulses, most of it's coming from Quantook-LOU. Fairly high-order encryption, as well."

"Who's he talking to?" Joshua asked.

"I don't think he is. It's short-range stuff, and there's no electronic activity in any of the tube systems. I think it's all being received by his bodyguard. I'm correlating their movements and his signals, and it looks like he's virtually remote-controlling them. The stuff they're sending back is completely different, probably sensor feeds so he can see what they're seeing."

"A regular little squad of drones," Ashly said. "I wonder if he doesn't trust them?"

"It's a bit late for us to start worrying about his status now," Joshua said. "Osiki, see if you can work out how to freeze up those bodyguards if the need arises."

"I'll try."

Joshua fixed their position twenty-five kilometres away from the sunside surface. Waiting was difficult for him. He really wanted to be down there with Quantook-LOU, seeing what was happening. That would put him in control and ready to respond immediately to whatever the situation threw at them. Just like he'd done at Ayacucho and Nyvan. The front line was the only place he could be sure things would be done right.

Yet if Ayacucho and Nyvan had taught him anything, it was that there was more to command than good piloting. He trusted his crew to handle the starship's systems well enough. Deploying the experts he had with him was an extension of that principal. That second time in Anthi-CL, when Quantook-LOU had become insistent, he'd known right away he shouldn't have been there in person. So now it was guilt rather than professionalism behind the decision to send the serjeants into the knot.

At least no one had protested that they should have been

sent as well. He rather suspected that the diskcity was getting to the others in the same way as it did to him.

They'd been holding station for fifteen minutes when Beaulieu's sensor monitoring programs alerted her that the sunscoop ship had altered its orbit. The massive fusion engines were firing, propelling it at a steady fiftieth of a gee. "It is now on an interception trajectory with us," Beaulieu told the bridge crew.

"Jesus, how long have we got?"

"Approximately seventy minutes."

Ione listened to Joshua's news about the sunscoop ship and told him: "All right, I'll ask Quantook-LOU."

They were in another of the dead tubes, the fifth so far, still churning up the dust as they swept through. Apart from the lack of air and fluid, they'd all seemed in reasonable condition. She could see no physical reason for their abandonment. Although at some point they'd certainly been stripped of all their ancillary equipment. Even a couple of the tube-end bulkheads had been salvaged, leaving gaping openings into the junctions.

She switched her communication block to the frequency the Mosdva were using. "Quantook-LOU, the captain has been in touch with me. He wants you to know that the sunscoop ship has changed direction and is now heading for the *Lady Macbeth*. Do you know anything of this?"

"I do not. The sunscoop belongs to the dominion of Danversi-YV. They are not allied to us on any level."

"Is it likely to pose a threat to our ship?"

"It does not carry any weapons. Their strategy will be to intimidate the *Lady Macbeth* into dealing with them, and to place their own group in this location in an attempt to block my progress. Do you have weapons capable of destroying it?"

"We are not sure of the effect our weapons would have. Captain Calvert does not wish to fire upon an unarmed ship."

“His views will change when the sunscoop’s fusion drive is pointing at the *Lady Macbeth*. Tell him that the dominion of Danversi-YV has suffered the loss of two sunscoops in the last fifteen years. They have been much weakened by this: their alliance has shrunk, diminishing their influence. They will be the first rim dominion to fail once I have the faster-than-light drive. That makes them the most desperate to obtain it for themselves.”

“Understood.”

The Mosdva glided out into a large junction chamber that had seven tubes radiating away from it.

“This could be interesting,” Ione told the others. “Judging by the position of two of these airlock hatches, the tubes behind them lead up into the knot. If they are tubes.”

“We have your location,” Liol replied. “You’re only a hundred and fifty metres from an inhabited surface tube.”

The Mosdva launched themselves from the bulkhead rim one after the other, heading unwaveringly for the first airlock hatch that led into the knot. They cut an oval of carbon-based composite out of the centre and went through.

“Looks like we’re avoiding the locals,” Ione said.

It was completely dark inside the tube. When the first serjeant squirmed through the hole its helmet sensors picked out six broad beams of ultraviolet light coming from the Mosdva up ahead. They were moving fast along the wall of the tube.

“I recognise this surface,” Ione said with as much excitement as her bitek neurones allowed her to generate.

The walls of the tube were made up from the same baked-sponge material that the Tyrathca had used in Tanjuntic-RI’s zero-gee sections. The serjeant’s armoured gauntlets could fit into the regular indentations, allowing them both to swarm up the tube after the Mosdva.

“No such thing as coincidence,” Joshua said.

“The airlock ahead is a different design,” Ione said. “Not like

those on Tanjuntic-RI, but not like the ones we've just come through, either."

The hatch at the centre of the bulkhead was a thick titanium square, with fat rim seals and piston-like hinges. It was three metres in diameter. Her infrared sensors showed it was a lot warmer than the tube walls.

The Mosdva had stopped at the bulkhead to apply small sensor patches to the metal. "The next section is in use," Quantook-LOU said. "I wish to avoid contact for now. We will go outside."

A patch of the ossified sponge was scraped off the wall with a power tool, revealing the glossy inner casing. They cut through it with a laser and slid out.

Ione switched her helmet sensors to infrared. They were deep inside the convoluted knot. She could see no order or pattern; tubes criss-crossed through space leaving small irregular gaps which were caged by thick struts, forming a bird's-nest filigree around her. Brilliant red threads revealed heat conduits running outside the tubes, while magnetic sensor imagery overlaid the translucent emerald lines of power cables.

"Plenty of activity here," Ione said. "But every tube is solid and opaque. Can't see in yet."

"What about where you're going?" Joshua asked. "Any ideas?"

"Not a chance. This is just too big a tangle to see more than a hundred metres in any direction."

Thick strips of the sponge material had been laid lengthways along each tube, allowing them to move about easily. The Mosdva started off with little fuss. Ione's guidance blocks told her they were moving still deeper into the knot.

After two hundred metres the clutter of tubes came to an abrupt end. The centre of the knot was a cavity over two kilometres broad. A cylinder eight hundred metres in diameter filled the centre, its hubs fixed to the surrounding tubes with heavy magnetic bearings, allowing it to rotate slowly. A band

of regular triangular ridges covered twenty per cent of the outer surface up at one end. Ione's infrared sensors showed the band glowing a soft uniform pink, much warmer than the rest of the shell. A radiator disposing of the cylinder's internal heat. Which meant the systems inside were functional.

"Well, well," she said. "Look at this. Somebody still enjoys a gravity field to live in." She scanned her sensors round. The cavity around the cylinder resembled a spaceport maintenance bay, gantry arms and support girders stuck out of the surrounding bulwark of tubing, threaded with conduits and hoses. They ended in sturdy clamp rings that sprouted long drill bits, inert and folded inwards like defunct sea anemones. Most were empty, though some of the clamps were gripping lumps of jet black rock. They'd been cut like diamonds, with hundreds of small sheer facets. There was no standard shape or size. One piece was so large it needed ten gantry arms to hold it in place, its contoured surface following the curve of the central cylinder. Most required only two or three clamps, while there were scraps that had been skewered by just a single drill bit. Units of machinery were clinging to the rock, so dark and cold they could have been complicated freak outcrops. Except for one, in the middle of the largest chunk, which glowed salmon pink with internal heat.

"A refinery of some kind," Ione guessed. "I think most of this rock is carbonaceous chondrite." As her sensor sweep continued, she picked out several dense magnetic fields. The equipment producing them was mounted on bulky platforms that encircled the cylinder. They looked like fusion drive tubes.

"Who lives here?" she asked Quantook-LOU. "It's the Tyrathca, isn't it?"

"This is Lalarin-MG. It is their designated location. I am displeased to find that they are still alive."

"But you hate them, they're your old slave masters. I thought you'd killed them off. That's what you implied."

"Those that remained at the end of the time of change

grouped together in their enclaves. They became difficult to dislodge. It was not worth challenging their defences. We excluded them from contact with the newformed dominions, and allowed them to decline in isolation. Only those that were the largest still exist.”

“That’s incredible,” Samuel said. “They’re like the grain of sand in an oyster; the Mosdva simply grew around them.”

“A very big grain,” Sarha said. “Take a close look at that cavity. I’ll bet you it was all asteroid rock when the diskcity was built, probably with a biosphere cavern hollowed out in the centre. They’ve had to refine it away over the millennia to supply themselves with fresh minerals, and the cylinder is most likely what the biosphere evolved into. They couldn’t expand like the Mosdva, so they just kept to the same size. We know they can keep that kind of society running indefinitely. Tanjuntic-RI was fully operational for the same length of time as this enclave. Except that one day they’re going to run out of rock to consume.”

“That fits what I can see, except for the rocket engines,” Ione said. “Why keep them functional when you need to expend every effort to maintain a highly artificial environment in adverse circumstances?”

“They might have been spaceship rockets originally,” Liol said. “Not any more. I think they were adapted into the defence system Quantook-LOU mentioned. Don’t forget, the Mosdva revolution happened when the diskcities were in their embryonic stage. The enclave asteroid would already be attached to the rest of the cluster at that time. If you use a fusion plume like a flame thrower, it would have caused havoc, completely broken apart the asteroids, destroyed the new inhabited tubes and thermal exchange mechanisms. The Tyrathca didn’t have anything to lose, but the Mosdva sure did. So both sides agreed to the isolation.”

“And the Tyrathca being unimaginative SOBs, kept their end of the threat in full working order all this time,” Ashly

said. "Fusion plumes could still do a lot of damage to a diskcity, even today."

"Except they're not all in full working order," Ione said. "I can see ten, of which only three have magnetic fields."

"Yes, but the Mosdva don't know that."

"They do now."

Quantook-LOU and the Mosdva bodyguard were on the move again, crawling along the tubes around the circumference of the cavity. Ione set off after them. "Looks like we're heading for the hub of the cylinder," she said. "He must be planning on going in to meet them."

"I'm beginning to respect old Quantook-LOU," Joshua said. "He's been pretty linear with us. Coming straight to a Tyrathca civilization is a good indication he genuinely wants to get the almanac for us."

"I wouldn't attribute his behaviour entirely to fair play," Syrinx said. "Our appearance gave him a simple choice. Go for the number one position, or see Anthi-CL be absorbed by someone else's unifying alliance. He doesn't want the almanac data, he needs it desperately."

"You never used to be this cynical."

"Not before I met you, no."

Joshua chuckled, wishing for the first time ever that he had an affinity bond. Not that he needed to check his own crew. Liol would be covering a grin, while Sarha would be casting a sly look his way and Dahybi would pretend it was all going way over his head.

"Trains are moving again," Beaulieu said. "The ELINTs are tracking five; they all started in the last ten minutes."

"So tell us why that's bad."

"They are all within a hundred and fifty kilometres of the Tyrathca enclave, and are heading towards it."

"Jesus! Wonderful. Ione, did you get that?"

"Confirmed. I'll tell Quantook-LOU, not that we can speed things along much at this point."

The serjeants were now climbing along a tube directly underneath the end of the cylinder, an uncomfortable position. The gap was gradually narrowing as they approached the hub, and the cylinder's monstrous inertia had become terribly apparent. Ione knew if she was fully human she'd be having constant memory recall of the day when she got her hand caught in her bicycle wheel (six years old, and she'd reached down to try and move a jammed brake block before Tranquillity could stop her). As it was, she could just appreciate the associative link.

"We will enter here," Quantook-LOU announced. The Mosdva stopped around an airlock hatch in a web junction. One of them placed an electronic module over the rosette keypad on the rim. After a moment, the module's green LEDs displayed a string of figures. They were tapped into the keypad, and the hatch locks disengaged, allowing it to swing down into the airlock chamber.

"We will go first," Quantook-LOU said.

Ione waited until the cycle had run, then both serjeants pushed down into the chamber. The inner hatch opened into the junction. Her suit sensors had to disengage filter programs to adapt to the light inside. It was white. She wondered how the Mosdva would cope with that—if they could actually see colour. Not that the question was high on her agenda.

The junction was a sphere thirty metres across, with seven hatchways set into it. Ten soldier-caste Tyrathca were standing around it at conflicting angles, their hoofs wedged deep into the sponge indentations, holding them perfectly still. They were pointing thick maser rifles at the Mosdva group.

Chittering and loud agitated whistles rang through the air as Quantook-LOU talked insistently to the single Tyrathca breeder who was standing among the soldiers. The distributor of resources had taken his suit helmet off.

"What are they?" the breeder asked, its hazel eyes had locked on the serjeants.

“Proof of what I say,” Quantook-LOU replied. “They are the creatures who have come from the other side of the nebula.”

“What Quantook-LOU says is true,” Ione said. “We are happy to meet you. I am Ione Saldana, one of the crew from the starship *Lady Macbeth*.”

Several of the soldiers rustled their antennae when she spoke. The breeder was silent for a moment.

“You speak as us, yet your shape is wrong,” it said. “You are not a caste we know. You are not a Mosdva either.”

“No, we are humans. We learned your language from the Tyrathca who came to our domain on the flightship Tanjuntic-RI. Do you know of it?”

“I do not. The memories of that age are no longer passed on.”

“Bloody hell!” Ione exclaimed over the general communication band. “They’ve junked their records.”

“It doesn’t mean that at all,” Parker said. “The Tyrathca pass useful memories down the generations via their chemical program glands. The details from fifteen thousand years ago are hardly likely to be relevant enough to be maintained in that fashion.”

“He’s right,” Joshua said. “We’re after their electronic files, not family legends.”

“I would like to mediate with the family that governs the electronics of Lalarin-MG,” Quantook-LOU said. “That is why we are here.”

“Tyrathca and Mosdva do not mediate,” the breeder said. “It is the separation agreement. You should not have come here. We do not come to your dominions. We maintain the separation agreement.”

“What about the humans?” Quantook-LOU said. “Should they be here? They are not a part of the separation agreement. The universe outside Tojolt-HI has changed for Mosdva and Tyrathca. A new agreement must be mediated. I can

do this. Allow me to mediate. All will benefit, Mosdva, Humans and Tyrathca.”

“You may mediate with Baulona-PWM,” the breeder said. “Two of your escort may accompany you, and the humans. Follow me.”

The tube which the breeder led them down was six metres in diameter, with a cable stretched along the centre supporting clusters of lights at regular intervals. All the Tyrathca walked along the walls as though they were in a gravity field. Their whip-like antennae were waving about with vigorous sweeping motions, like undersized wings. Ione realized the breeder’s antennae were much longer than those of the Tyrathca she was familiar with.

“We always believed them to be balance aids,” Parker said. “It would appear low gravity has encouraged their reuse.”

Her sensors swept over the breeder. It was about ten per cent smaller than Confederation breeders, although it appeared fatter. A smattering of the scales on its sienna-coloured hide had turned pale grey, and there were small lumps on its leg muscles. Its breathing seemed to be mildly erratic, almost as if it was wheezing. When she checked the soldiers, they had similar blemishes. Two of them were also running a temperature.

“They haven’t come through the isolation as well as the Mosdva,” she said.

“Small population base,” Ashly said. “They’ll be running into inbreeding problems. Couple that with the kind of medical difficulties which you get from exposure to freefall, and they’ll probably have a high number of invalid eggs. Considering they don’t have a research base to examine and counter the problems, they’ve done well to survive this long.”

The last tube opened out into the rotating airlock. It was a layout remarkably similar to the one in Tanjuntic-RI, a long cylindrical chamber with three large airlock hatches at the far end leading into Lalarin-MG and a pressure seal halfway

along. A low rumbling sound vibrated through the atmosphere as the giant cylinder revolved.

The flightship design was carried over on the other side of the airlock. A waiting freight lift was flanked by archways leading directly onto spiral ramps.

Everyone crowded into the lift together, and it started to descend. Gravity built slowly, causing trouble for the three Mosdva. They had to remove their spacesuits entirely to free their hindlimbs, allowing them to stand on them and their midlimbs. It wasn't easy; their club-like hind feet were evolving away from dexterity, while their midhands were almost too delicate to carry half of their body weight. When the lift reached the base of the cylinder, gravity was fifteen per cent Earth standard. The Tyrathca were perfectly comfortable with it; Ione reprogrammed her suit actuators to take it into account, making sure the serjeants didn't go power leaping and compensating for the coriolis factor. Quantook-LOU staggered slowly, moving his limbs with painful unfamiliarity. His two bodyguards were a little better off; they had prosthetic midlimbs to take the weight. Servo mechanisms whined loudly with their every movement. Ione wondered what kind of strain weight was putting on their organs and heart.

The lift doors opened, revealing the interior of the cylinder. Ione had to bring more filters on line to compensate for the glare.

Lalarin-MG was a single open space enclosed by a cyclorama of aluminium alloy. The floors were fully occupied by rank after rank of buildings, the standard tapering towers of all Tyrathca settlements. Here, though, they were built out of some jet-black composite; thick pipes and knobbly segments of equipment protruded from the walls, as if they were machines rather than residences. Countering that impression were lush vines with broad, droopy emerald and lavender leaves that scaled the walls, sprouting rings of

large hemispherical turquoise and gold flowers. Thin strata of mist drifted up from the grid of streets, merging together into an unwavering pearl-grey haze as they curved their way towards the axis. Every rooftop supported a battery of brilliant lights which shone directly upwards, their broad beams intersecting within the haze and diffusing slightly before they illuminated the section of floor directly overhead.

The cylinder's sheer endwalls were simple circles of moss, broken into an elaborate tessellation pattern by structural reinforcement ribs and interconnecting spars. A slender axial gantry ran the length of the cylinder. With one interruption.

"Oh my God," Ione said. "Can everybody see that?"

"We see it," Syrinx said.

In the absolute centre of the cylinder, suspended from its tips by the axial gantry, was an effigy of the Sleeping God. From tip to tip it measured two hundred metres, giving it a diameter of a hundred and fifty at the flared central disk. Originally the surface had been given a polished metallic sheen, now it was streaked by thick runnels of algae, with tufts of sickly brown fungi sprouting from pocks and cracks. Both spires were mottled by encrustations of lichen.

The Mosdva paid it no attention as they walked painfully along the narrow streets between the towers. Humidity was high. Every surface was beaded with condensation, horizontal ledges and pipes dripped constantly. The eternal background pattering sounded like a gentle rainfall.

Tyrathca breeders (always in pairs, Ione noticed) crowded every intersection along the street, chattering among themselves as the procession made their way into the cylinder. There were few vassal castes in evidence, and most of those were soldiers. Farmers tended the curtains of vines with slow arthritic movements, training new shoots up the trellis and picking the ripe clusters of dark purple fruit.

As they walked slowly through the buildings, her impres-

sions of Lalarin-MG clarified. The interior of the cylinder had the same pattern of lethargic decay that was present across all of Tojolt-HI. Some buildings were in good repair; one or two were actually new, their siege of vines barely reaching up to the first floor windows. But for every new one, four were disused. Even the equipment on the walls of the occupied towers was allowed to fail; magnetic and infrared sensors revealed the casings were inert, sharing the ambient temperature.

“They’re on the border between stability and stagnation,” she said. “And edging over the wrong way.”

“It’s the biological aspect,” Ashly said. “It has to be. It’s the one negative factor at work here. They need to interbreed, inject some vitality back into the family bloodlines. They’ll die out for sure otherwise.”

They finally came out on an annular plaza directly underneath the Sleeping God effigy. It was paved with slabs of aluminium coated with a rough layer of quartz for traction. Overhead, long ribbons of algae dangled from the effigy’s rim, as if it had been given a raggedy skirt. Water showered down from the fringes, falling in a wide curve to sprinkle the whole plaza.

Tyrathca breeders were lined up along the edge of the aluminium slabs, sheltered from the drizzle. They were sitting on their hindquarters, antennae rising high from the shaggy manes running down their spines.

The soldier caste guard all halted at a single piping command from the breeder. Quantook-LOU immediately sank down so his lower belly was resting on the slabs. His breathing was coming very fast.

A breeder rose from the row of Tyrathca and came over to stand in front of the serjeants. An old one, Ione guessed. Its hide was covered in white and grey patches, rheumy fluid leaked from its eyes, and it seemed to have some trouble focusing.

“I am Baulona-PWM, my family regulates electronics throughout Lalarin-MG. The Mosdva I know of. You I do not.”

“We are humans.”

“The Mosdva distributor of resources claims you have travelled from the other side of the nebula to visit Mastrit-PJ.”

“We have.”

“Did the Sleeping God send you?”

“It did not.”

Baulona-PWM tilted its head back against the soft warm rain, and let out a soft keening. The other Tyrathca around the plaza followed suit. A mournful chorus of dismay.

“Do humans know of the Sleeping God?”

“We do.”

“Have you seen it?”

“No.”

“We have called to the Sleeping God for its aid since before the separation agreement. We called when the Mosdva began the slaughter of our clans. We called when we were herded into our enclaves. We have called to it continuously for every moment since. There is always one of us here to call. The clan riding in Swantic-LI said it sees the universe. They said it is our ally. Why then does it not answer?”

“The Sleeping God is a long way from Mastrit-PJ. It might take a considerable time for it to arrive to help.”

“You bring us nothing new.”

Quantook-LOU straightened his midlimbs, rising off his belly to look from the serjeants to Baulona-PWM. “What is this Sleeping God?”

The old breeder hooted loudly. “One day you will know. The Sleeping God is our ally, not yours.”

“I am here to make new allies. Humans have changed our agreements. They have come here in a ship that travels faster than light.”

Baulona-PWM’s head pushed forward to within ten cen-

timetres of the first serjeant. “The Sleeping God knows how to travel faster than light. How can you do this without its help?”

Ione used the general communication band to say: “I think we should avoid anything that sounds like blasphemy at this point. Suggestions?”

“Tell them it was a gift from our God,” Syrinx said. “They can hardly argue with that.”

“I don’t want to put any pressure on,” Joshua said, “but we haven’t got much time until that sunscoop ship rendezvous. And those trains are still closing on you. If it looks like Quantook-LOU can’t swing a deal, then we’ll just have to deal with the Tyrathca directly.”

“Understood,” Ione said. “The faster-than-light drive was given to us by our God,” she told the old Tyrathca breeder.

“You have a God?”

“Yes.”

“Where is it?”

“We don’t know. It visited our world a long time ago, and hasn’t yet returned.”

“The humans will give me the faster-than-light drive,” Quantook-LOU said. “It will provide the Mosdva dominions with fresh resources. We will build new diskcities. We will be able to leave Mastrit-PJ as the Tyrathca did.”

“Give us the drive,” Baulona-PWM said.

“The drive is mine,” Quantook-LOU said. “If you want it, you will mediate with me. That is why I have come to you.”

“What do you want from Lalarin-MG?”

“All data and records on the Tyrathca flightships.”

Baulona-PWM hooted sharply. The soldiers shuffled round, agitated.

“You would know where our new worlds are,” Baulona-PWM said. “You would destroy all Tyrathca. We know the Mosdva. We never forget.”

“Neither do we,” Quantook-LOU hooted back. “That is

why we must mediate now. If not, then Mosdva and Tyrathca will wage war again. You know this. Humans say they will help neither of us unless we have a new arrangement that will prevent war.”

“Smart argument,” Ione said to the others. “I think I can see where he’s taking it.”

“What is the new arrangement?” Baulona-PWM asked.

“The humans do not want war in this part of the galaxy. If we are to have the faster-than-light drive, then Mosdva must not use it to fly to stars with Tyrathca worlds. We must know where they are to avoid this.”

“That’s the condition we make for giving you the drive,” Ione said. “We know of your history, and the conflict between you. We will not permit that conflict to begin again and engulf other species. There is room in this galaxy for the Mosdva and Tyrathca to exist peacefully. It will be like the separation agreement you have here, but on a much larger scale.”

“We have our weapons to make the Mosdva obey the separation agreement here,” responded Baulona-PWM. “What will make them obey after you give them the faster-than-light drive, and they know where our new planets are? With this drive they will leave Tojolt-HI. Our weapons will mean nothing. They will destroy all Tyrathca at Mastrit-PJ. They will destroy all Tyrathca new worlds.”

“You destroy,” Quantook-LOU said. “We build.”

“Mosdva do not keep agreements. You send your soldiers against Lalarin-MG. They are here now. We will use our weapons against all of Tojolt-HI.”

“Can you confirm this?” Ione asked the *Lady Mac*’s crew.

“We’re picking up some Mosdva movement on the dark-side,” Joshua said. “Looks like they’re infiltrating the tubes around the edge of the knot.”

“How many?”

“Several hundred. It’s a large infrared signature.”

“Are these the ones from the trains?”

“No. The first train won’t be there for another fifteen to twenty minutes.”

“They are not Anthi-CL soldiers,” Quantook-LOU said. “They are from the dominions who would use the human’s drive for themselves. I will mediate with Tyrathca, I will make agreements with Tyrathca. They will not. Give me the information. Once I have the drive, they will have to retreat from Lalarin-MG.”

“Make them retreat now,” Baulona-PWM said. “When they are gone, I will mediate with you.”

“I cannot mediate with the other dominions until I have the information.”

“I will not give you the information until you mediate.”

On the *Lady Mac*’s bridge Joshua banged a fist into his couch cushioning. “Jesus! What is wrong with these people.”

“Twenty thousand years of hatred and strife has become hereditary in both of them,” Samuel said. “They can’t trust each other, not any more.”

“Then we’re going to have to break the deadlock.”

“We’re about out of time on that front,” Liol said. “The sunscoop has just reduced its deceleration thrust.”

“Oh shit,” Joshua mumbled. He knew what that meant. The flight computer datavised the huge ship’s new trajectory into his neural nanonics. With a reduced thrust the sunscoop wouldn’t have nullified its velocity in time to stop beside the *Lady Mac*, twenty kilometres above Tojolt-HI’s sunside. According to the new vector, it would end up one kilometre above the darkside of the knot which contained Lalarin-MG. And as it was approaching the knot drive first, its fusion plume would slice clean through the Tyrathca enclave, vaporizing the entire structure. It was also due to pass uncomfortably close to *Lady Mac*.

“I think we’re going to have to take a more active interest,” Joshua told the bridge crew. He aligned *Lady Mac*’s

main dish on the sunscoop. "Attention sunscoop ship. Your present course will result in the destruction of Lalarin-MG. Members of my crew are currently inside this dominion. Increase your deceleration thrust immediately."

"Josh, it's over four kilometres across," Liol said. "That's not a ship, it's a mountain. Even if you nuke it, the debris will still rip this section of Tojolt-HI to pieces. In fact you'll probably do more damage that way."

"I thought I'd told you how I dealt with Neeves and Sipika in the Ruin Ring."

"Oh," Ashly said dryly. "You mean that was a true story?"

Joshua gave the pilot a wounded look.

"No response from the sunscoop," Liol said. "And no change in thrust. They're still going to burn through the knot in eight minutes."

"Okay, if that's how they want it. Combat stations, please."

Lady Mac's thermo dump panels folded down into their hull recesses. Joshua ignited the main fusion tubes, and closed on the sunscoop at one and a half gees.

"This is going to be one very fast flyby," he said. "Sarha, you have primary fire control."

"Aye, Captain," she acknowledged. Her neuroiconic display was already showing her the sunscoop: a cluster of incandescent globes sitting on top of an even brighter flame of plasma that stretched out over thirty kilometres before dissolving into a hazy tip of blue ions. It descended relentlessly towards the vivid copper sunside like some gigantic insect stinger.

The flight computer datavised a stream of targeting data, overlaying her image with a bright purple grid. Under her guidance, it split into five segments and wrapped each piece around one of the incandescent globes. She upped the power level from the main tokamak generators and activated the maser cannon.

Lady Mac swept past the sunscoop in a shallow curving

trajectory, keeping a constant twenty kilometres away from the fusion plume. Her masers fired at the five storage globes, each beam piercing clean through the radiant thermal dissipation material. Fissures of darkness streaked out from the impact points. The beams began to chew round in a tight spiral, widening the holes. Whatever the casing material was, its physical resistance to the microwaves was minimal. Ninety per cent of their energy went directly into the massive reservoir of hydrocarbon fluid stored inside. It started boiling immediately, belching out clouds of hot vapour. Pressure began to build up inside the globes, sending vast jets of blue-grey gas roaring out through the gashes.

"Delta-V change," Liol reported. "The punctures are creating thrust. Christ, Josh, it works."

"Thank you. Sarha, keep those lasers centred, I want to heat as much fluid as we can. Stand by, reducing thrust. Let's try and avoid coming back for a second pass."

"Captain," Beaulieu called. "The sunscoop drive is switching off."

Lady Mac's combat sensor clusters tracked the sunscoop, showing Joshua the fusion plume dwindling away. "Shit, did we do that?"

"Negative," Sarha said. "My shooting's not that bad. Drive systems are intact."

"Liol, give me a trajectory update please."

"They've got a smart captain. Without the fusion drive, the gas plumes aren't enough to kill their velocity. They're going to hit the knot. Impact in four minutes."

"Damn it." Joshua immediately began plotting a new vector, taking *Lady Mac* round for another pass. The starship began accelerating at four gees. He had to be careful their own plume didn't wash across the sunside webs.

"Sunscoop gas vents are reducing," Ashly said. "The fluid must be cooling again. That thermal dissipation mechanism

of theirs is bloody good, Joshua. It's worth giving them the ZTT drive in exchange for that."

Lady Mac was racing back towards the sunscoop. Sarha fired the masers again, to be rewarded by the sight of the gas jets thickening. The glare of the storage globes fluoresced them a blazing silver-white as they emerged from the holes; then they shaded down along their length until their diffuse tails shimmered cerise.

Two lasers struck *Lady Macbeth*, fired from somewhere on the diskcity's sunside. Joshua rolled the ship fast as their thermal protection foam flash-evaporated, scoring long black lines across the fuselage.

"No penetration," Beaulieu called. "We can handle this energy level for eight minutes. Thermal reservoirs will be saturated after that."

"Acknowledged." Joshua accelerated the starship at eight gees, heading back down to the sunside surface. Everyone tensed against the crushing gravity as the sensors showed them the red and gold corrugations hurtling towards them. *Lady Mac* flattened out, flying parallel to the diskcity, sixty metres from the tops of the web tubes. Her fusion drive cut out, leaving them in freefall.

"Lasers lost us," Beaulieu said. "They can't track us at this altitude."

Behind them the sunscoop continued on its approach towards the knot. The five storage globes were glaring furiously as they tried to throw off the energy imparted by *Lady Mac*'s masers during the second pass. Success was measured by the way the gas jets were slowly shrinking.

"It's going to be close," Liol said. "But I think we've done it."

Joshua followed the flight computer's plot. Watching the sunscoop's relative velocity winding down, comparing the rate against the declining gas vents. Flakes of grey slush had started to clot the ever-reducing gas jets. But it was going to

work, he told himself. The figures were tight, but the ship would reach zero relative velocity sixty kilometres above the diskcity.

Datavised alarms suddenly glared across his neuroiconic display. *Lady Mac* was under attack again. Energy impacts bloomed against the fuselage, ablating patches of foam in spurts of soot.

“Lasers again,” Beaulieu said. “They can’t stay on us for more than two or three seconds at a time, but there’s a lot of them. They’re going for a coordinated saturation. Strikes are almost constant.”

“Quantook-LOU warned us the dominions would try to stop us leaving before we handed over the data,” Samuel said. “They must think that’s what we’re doing.”

Joshua checked their vector. At their current velocity they’d fly over the rim in another hundred seconds. The course was taking them a long way round from Anthi-CL. He datavised the flight computer for a tactical analysis. “The old girl can handle this level of fire. We don’t need to jump clean yet.”

Lady Mac’s sensors were still tracking the sunscoop ship. It was sixty-five kilometres away from the sunside, with its approach velocity down to ten metres per second. The five jets from its storage globes were still active, though the rents weren’t squirting gas any more. It was mainly liquid and slush pouring out now. At sixty-three kilometres, its velocity was two metres a second.

The vector reversed at sixty-one kilometres. For a moment the sunscoop was stationary, then it began to creep away from the diskcity again at an almost unmeasurable velocity. By now the flow from the storage globes was reduced to a splutter of mushy fluid dribbling away into space.

Its fusion drive ignited.

Joshua groaned in dismay as *Lady Mac*’s flight computer translated the sensor image into pure data, providing him with the figures for the plasma’s temperature, luminosity,

and flow rate. This time the sunscoop was using its full thrust. The tip of the plume seared its way downwards as the giant ship began to accelerate away. There was never going to be time for the separation distance to increase beyond the range of the plasma spear.

The drive flame hammered against the crown of the knot, instantly vaporizing every tube and foil sheet it touched. A blast wave of superheated gas roared out through the tangle of tubes inside the knot, rupturing web junctions and sending shredded tube fragments whirling deeper into the tangle. Slow structural ripples flexed their way across the sunside, radiating sinuously out from the knot. Tubes cracked open around junctions and reinforcement ribs. Hundreds of fan-shaped fountains of circulation fluid and atmospheric gas howled out into space across an area fifty kilometres across, producing a stormy pellicle of crimson mist which hung over the surface. Its centre was energized to azure blue by the fusion plume from the retreating sunscoop, expanding in a perfectly symmetrical ring, swelling and fading as it raced away across the sunside.

The devastated Mosdva dominions around the knot retaliated. Every laser that remained functional was fired at the sunscoop. Small petals of darkness opened across the glaring storage globes, distending. Sprays of molten metal drifted out from the drive nozzle, followed by boiling globules of fluid. The plasma flame began to waver as it was contaminated by streaks of impurity burning emerald and turquoise.

The thick shadows slithering over the storage globes merged together into funereal blemishes until the light was completely extinguished. They shattered in unison, belching out thick wobbling rivers of hydrocarbon fluid. It began to evaporate under the red giant's unrelenting radiance, producing a surge of oily fog. A huge patch of shade crept over the sunside, defacing its usual gleaming hue to a dusky claret.

"Christ," Liol gasped. "Did we do that?"

“No,” Dahybi said. “But they’ll blame us anyway.”

“Ione?” Joshua asked. “Are you all right?” He concentrated on the general communication link. The view through the serjeants’ sensors was shaking badly. The effect of the sunscoop’s plasma strike against Lalarin-MG was the same as an earthquake. Tyrathca breeders were scattered across the plaza, struggling to regain their footing. The soldiers had closed in on the three Mosdva, prodding them with their big maser rifles.

“We’re okay,” she said. The serjeants began to scan round. “No sign of structural breakdown. The cylinder is still intact and rotating.”

“That’s something.”

Above the serjeants, the Sleeping God’s effigy was moving in a circular bouncing motion, completely out of phase with the cylinder’s rotation. The axial gantry securing it bent and stretched with frighteningly loud stress creaks.

Baulona-PWM walked unsteadily over to Quantook-LOU. The distributor of resources was suffering in the aftermath of the attack, unable to lift himself up from the juddering plaza.

“Mosdva break their separation agreement,” Baulona-PWM said. “You damage Lalarin-MG. You kill our vassal castes. We will fire our weapons at Tojolt-HI. You will be exterminated.”

“Wait,” Ione said. “You cannot exterminate Quantook-LOU. He is the only Mosdva willing to deal with you. Without him there will be war. Billions of Tyrathca will die because you exterminated him. Their deaths will be your fault.”

“They will not die if you leave Mastrit-PJ. Do not give the Mosdva your faster-than-light drive. The Tyrathca here will survive. The Sleeping God will come to aid us.”

“The Mosdva will be given our drive. That is why we have come, to bring balance to the galaxy. The Tyrathca from Tanjuntic-RI were given the drive.”

“Tyrathca have faster-than-light drive?” Baulona-PWM demanded.

“Some of your worlds have it, yes. The technology is spreading slowly. Outside Mastrit-PJ your race is becoming powerful. Humans and our xenoc allies will not permit that to happen. There must be balance and harmony between races, only then can there be peace.”

Quantook-LOU heaved down a breath, but still made no effort to rise. “Humans are stupid,” he said. “Why did you give Tyrathca the drive? Can you not see what they are?”

“We know what both of you are. That is why we are here. Now you must choose. Will you mediate a new agreement? Will you pursue peace?”

“What will you do if we do not mediate an agreement?” Quantook-LOU asked.

“The balance will be enforced by us,” Ione said. “We will not tolerate war.”

“The Mosdva will mediate an agreement for peace,” Quantook-LOU said. “If the Tyrathca of Lalarin-MG do not wish to mediate with me, I will find an enclave that will.”

“Baulona-PWM, what is your answer?” Ione asked.

“I will mediate,” the breeder said. “But the Mosdva still attack Lalarin-MG. They must stop. There can be no agreement if we are dead.”

“Quantook-LOU, can you get the other dominions to withdraw?”

“I cannot. I must have the drive first, and the *Lady Macbeth* must leave. Only then will they be forced to ally with me.”

“You can’t have the drive until we have the Tyrathca information,” Ione said. “Baulona-PWM, how long will it take you to recover the information necessary for the agreement?”

“I am uncertain where it is stored. Our old memory centres are no longer enabled. We would have to reactivate them.”

“Wonderful,” Joshua exclaimed. “Not even total catastro-

phe can loosen these bollockheads up. Beaulieu, what's happened to the trains?"

"Three of them are still en route, Captain. And the surviving Mosdva in spacesuits are still infiltrating the knot on the darkside."

"Jesus, we have to buy Ione some time."

"We could go back to the knot and use our firepower to defend Lalarin-MG from the Mosdva troops," Liol suggested.

"No." Joshua rejected it automatically. It would be messy, he knew. *Lady Mac* might be the most powerful ship in the system, but she wasn't invincible. They needed some way of isolating Lalarin-MG while the Tyrathca breeders found the almanac. And maybe Quantook-LOU really could negotiate some kind of peace settlement. Nice bonus.

He let the factors stream through his mind. With that arrogant Calvert certainty that they had to act on Lalarin-MG, it was just a matter of running through options. Thinking what he had available to work with.

Joshua started chuckling wickedly.

Ashly closed his eyes in prayer. "Oh shit."

"Syrinx," Joshua called. "I need *Oenone* down here."

One of the serjeants bent down beside Quantook-LOU. The distributor of resources had rolled partially on his side, which was why he couldn't right himself. His bodyweight was trapping his midlimb. Ione pushed his flank as hard as she dared; too much pressure would snap his bones.

"I thank you," Quantook-LOU said as his midlimb wriggled free. "You would make an excellent Mosdva. Even I am adrift among your mediating strategies."

"A compliment indeed. My prime requirement, however, remains unchanged."

"I understand. I will play my part."

"Good."

"In the expectation of reward."

“You will collect the drive. Humans keep their word.”

“A welcome assurance at this point.”

The other serjeant had gone to talk to Baulona-PWM. They stood in the middle of the plaza, with the dirty rain from the effigy falling around them. The drops were less frequent, but larger, as the effigy continued its slow gyrations. “My ship tells me that the Mosdva troops are invading the area around this cylinder,” Ione said. “Can your soldiers hold them off long enough for you to retrieve the information?”

“How do you know this? We can detect no communication with your ship.”

“It is a method you are not familiar with. Now, can you hold them off?”

“We have no soldiers left outside Lalarin-MG. All is wrecked. Our food is grown in the tubes. There is no air, no fluid. Our communication links are failing. Our fusion weapons are disabled. Does your ship have weapons which can help us?”

“Not weapons, but we can certainly help. I will need your agreement to act as the mediator between you and Quantook-LOU.”

“Why?”

“If you supply me with the information which makes the agreement between Tyrathca and Mosdva possible, I may be able to offer all the Tyrathca of Lalarin-MG passage to one of the new Tyrathca worlds. It will not be today, but after we return to our home we can send larger ships to collect you. They could be here in three to four weeks.”

“We will be dead within one hour. Mosdva will come to break open Lalarin-MG’s shell.”

“My ship can move Lalarin-MG away from Tojolt-HI. The Mosdva will no longer be able to reach it. This will give you time to retrieve the information and mediate an agreement with Quantook-LOU.”

“You can move Lalarin-MG?”

“Yes.”

“Once we leave the shadow of Tojolt-III, we will be unable to get rid of the sun’s heat. Our radiator bands are only sufficient to rid us of the heat we produce inside.”

“Mediating the agreement won’t take that long. You will find and supply the astronomical information to me. When I am satisfied it is correct, I will release the drive to Quantook-LOU and leave. All hostilities will then cease and the agreement will become active. You can travel back to another enclave to wait for our ships to collect you.”

“I agree to this.”

Joshua varied *Lady Mac*’s acceleration at random as they flew back to the wrecked knot, making targeting difficult.

“Nobody’s shooting at us,” Liol said. It was almost a complaint. Heavy fire might have made Joshua rethink this whole idea. Then again, part of him was looking forward to this with disgraceful childish glee. As he suspected his younger brother was, as well. The rest of the crew treated the notion with an air of tolerant amusement. And Ione was doing a good job talking rings around the xenocs.

He had to admit, everything was falling into place.

“That’s because we’re going the wrong way to be shot at,” Monica said. “We’re coming back to them. It’s leaving they object to.”

“I wonder what they’ll make of this, then,” Joshua said.

Lady Mac glided over the edge of the knot. Virtually all of the foil sheets had been torn away from its sunside slopes, letting the red sunlight illuminate the snarl of dark tubes which made up the interior. Space around the knot was heavy with particles, crystals and scraps of foil reflecting the sunlight in a blossom of crimson scintillations. The sun-scoop’s plasma torch had blown out a huge crater at the crest of the knot. Three hundred metres in diameter, its walls were

a stipple of fractured tubes with melted ends. They were still glowing coral red from the immense thermal barrage.

"I'm taking us in," Joshua said. "Beaulieu, start saturating the knot."

"Aye, Captain."

The cosmonik switched the maser cannons to wide-angle dispersal and began hosing the microwave energy around inside the crater. It wasn't powerful enough to damage the structure any further, but it would be lethal to any of the Mosdva creeping round inside the knot.

Joshua rolled *Lady Mac* and started to edge her down into the crater. He used the forward lasers to slice through the tubes and wreckage at the bottom. Sections began to drift free, vapour from their molten ends blowing them away gently. Chemical verniers fired around the starship's equator, moving it deeper into the crater.

Oenone slipped out of its wormhole terminus thirty kilometres above the knot's darkside. The Edenists in the life-support toroid were all borrowing its sensor blisters, looking out in admiration at the monumental diskcity. Syrinx shared a smile with Ruben, their minds cherishing the vista together. Little bursts of excitement wafted around the mental embrace which pervaded the bridge as new facets of the xenoc construction were noticed and cherished. None of the ELINT coverage compared to actually being here.

The tall pinnacles of thermal radiators glowed a steady orange in the voidhawk's senses. It could feel the broad fans of heat they gave off, slucing away through space towards the distant nebula. In the visual spectrum, Tojolt-HI was almost black. The exception came from the area where the sunscoop had attacked. Foil sheets had either been torn free or disintegrated, allowing sharp beams of intense red light to steal through the cluttered webs.

If Wing-Tsit Chong and the therapists could see me now, Syrinx said contentedly.

They don't need to, Ruben said. They know they did their job properly.

Yes, but it still galled when they said it. Just a timid tourist, indeed!

I am glad we came, *Oenone* said. Everything here is fresh, but old at the same time. I feel Tojolt-HI has a dependability about it.

I know what you mean, she told the enchanted void-hawk. Anything that has such a long past must surely have an equally long future ahead of it.

It did have until we arrived, Ruben said.

You're wrong. The Mosdva can't abandon it, nor any of the others. Ashly is right, ZTT won't give them that option. But maybe we'll see change. Progress will begin again. I prefer to think of that as being our legacy. And who knows what they will achieve with fresh resources and new technologies.

Let's not get ahead of ourselves.

You're right. The briefest glimmer of regret appeared amid her thoughts.

I'm picking up considerable radar activity above this side of the diskcity, Edwin said. I think our countermeasures are deflecting them.

Thank you, Syrinx said. Nothing we can do about visual acquisition, I'm afraid. And we're silhouetted against the nebula for all Tojolt-HI to see. Serina, have you acquired the trains?

Got them.

Cut the rails.

Five lasers stabbed out from the weapons pods clamped in *Oenone's* lower hull groove. They slashed through the rail tracks meandering across the darkside's huge thermal radia-

tors. Serina waited until the trains had halted, then used the lasers to chop the rail behind them.

Immobilised, she said. **They can't invade Lalarin-MG now.**

They'd be pretty stupid to try, Edwin said. **Our electronic sensors are picking up the *Lady Macbeth's* microwave emissions from here. They're powerful enough to leak through the knot.**

Let's go give him a hand, Syrinx told *Oenone*.

The voidhawk darted in towards the diskcity. They came to rest directly over the knot. *Oenone's* distortion field undulated through the damaged tubes and struts, allowing the Edenists to examine its anatomy. The remaining scraps of asteroid rock in the knot's central cavern were dark zones, their mass exerting a minuscule gravity field against space time. Next to them, the cylinder rotated slowly, its thin shell nothing more than a murky shadow to the voidhawk's perception. Power circuits formed a grid of fuzzy violet lines permeating the whole edifice as the electron flows emitted their unique signature. The greatest concentration of energy was swirling around the magnetic bearings at each hub. Small instabilities flickered within the translucent folds, tarnishing the emissions. Barely fifty metres past the far end of the cylinder, *Lady Macbeth* appeared as a bright, dense twist in space-time.

"Got it, Joshua," Syrinx said over the general communication link. "The cylinder masses approximately one-point-one-three million tonnes."

"Excellent. That's no problem. With the antimatter drive, *Lady Mac* can hit forty gees, and we mass just over five thousand tonnes. That should give us nearly a fifth of a gee thrust."

"All right, we'll start cutting."

Ruben, Oxley, and Serina all issued instructions to the bitek processors governing the weapons pods. Eighteen

lasers fired from the voidhawk's lower fuselage, and under the crew's directions began cutting through the tubes at the top of the knot.

Lady Mac's sensors could now focus on Lalarin-MG itself. Her lasers had scythed their way through the tangle of tubes and struts, clearing a broad passage which Joshua had steered the starship along. Hot segments of tube twirled away into the main cavity, bouncing against the metallic cylinder shell and the black lumps of rock. Light was filtering in for the first time in a hundred centuries. Trickle of red sunlight slipped past *Lady Mac*'s fuselage, complemented by sizzling scarlet flashes of the lasers.

"How's it going in there, Ione?" Joshua asked.

"We're ready. Rotating airlocks are closed and sealed. I even got Baulona-PWM to find some padding for the Mosdva to lie on."

"Okay, stand by." The sensors were showing him the cylinder's hub with its big circular bearing dead ahead. He cut the last tube free, exposing the airlock chamber, and fired the ion thrusters to spin *Lady Mac*, matching her rotation to the cylinder. The starship's forward fuselage section moved into the bearing, crushing the jagged remnants of the tube. "Sarha?"

"I've got the molecular binding force generators on maximum."

"Take the CAB safety limiters off line. Pump them higher. I want all the strength we've got in the stress structure."

"You've got it."

"We've cut this end free," Syrinx said. "You're clear."

"Okay everyone, stand by." Joshua fired the fusion drives, keeping their thrust to an easy one gee. *Lady Mac* pressed forward, compressing the remnants of the airlock chamber in towards the cylinder shell. The rim of the bearing pierced

the starship's protective foam until it was touching the fuselage.

"We're solid," Liol declared.

Joshua increased the fusion drive thrust. Three strands of blue-white plasma stabbed back out through the crater, twining together. Tubes and struts facing the ultraheated torrent of ions began to boil furiously, sending out twisters of gas.

"Stress structure's holding," Sarha said. The sound of the drive tubes was vibrating through the life support capsules, a muffled drone. She'd never heard that before.

"It's moving," Beaulieu called out. "Accelerating at four per cent of a gee."

"Okay, here we go," Joshua said. He activated the anti-matter drive.

Hydrogen and anti-hydrogen collided and obliterated each other within the engine's complex focusing field. A shaft of pure energy burst into existence behind the starship, as if a flaw in space-time had cracked open. Two hundred thousand tonnes of thrust started to push Lalarin-MG out of its rapidly dissolving chrysalis.

"I think we might have something," Etchells said.

Kiera looked up from the pizza slice she was munching through. A couple of the console displays were showing elongated stars being lassoed by turquoise nets, columns of scarlet figures scrolling past too fast to be read. So far all the hellhawk had found was some radar-type pulses coming from (presumably) stations orbiting the huge star. They gave nothing away, other than the fact they weren't Confederation. Kiera and Etchells both wanted to see if anything else existed before they started investigating.

"What have you seen?" she asked.

"Take a look for yourself."

The gauzy iridescent clouds of the nebula slid across the

bridge's main port as the hellhawk swung round. Bright crimson light shone in as it faced the red giant again.

Kiera dropped her pizza back into the therm box and squinted against the glare. Right in the middle of the port was a dazzling white spark. As she watched, it grew longer and longer.

"What is that?"

"An antimatter drive."

She smiled grimly "It must be the Confederation Navy ship."

"Possibly. If it is, there's something wrong. An antimatter drive should accelerate a ship at over thirty-five gees. Whatever's producing that drive flare is barely moving."

"We'd better take a look then. How far away are they?"

"Roughly a hundred million kilometres."

"But it's so bright."

"Nobody really appreciates how powerful antimatter actually is until they encounter it first hand. Ask the ex-residents of Trafalgar."

Kiera gave the apparition a respectful look, then went over to the weapons console. She started arming the combat wasps. "Let's go."

Joshua switched all the starship's drives off as soon as Lalarin-MG cleared the crest of the knot. The flight computer had to tell him where that was. Tojolt-HI's structure had simply melted away from the antimatter drive, leaving a hole over eight kilometres wide where the knot had been. The fringes glowed cerise, extending bent tendrils of molten metal. Only the largest lump of asteroid rock had survived intact, although it was down to a quarter of its original size. It tumbled in towards the photosphere, its surface baked to a cauldron of bubbling tar, spewing out a guttering tail of petrochemical fog.

The red giant shone through the huge circular rent in the

diskcity, illuminating the end of the cylinder and a tapering slice of the shell as if a flame was playing up the side. *Lady Mac*'s ion thrusters fired, backing her out of the crushed bearing ring. The hub had bowed inward under the enormous force she'd exerted, but the rib spars had held. Now they were retreating from the diskcity at a leisurely thirty metres per second.

"And they're still not shooting at us," Liol said.

"I should hope not," Dahybi retorted. "After that little display of power they'll think twice about antagonising us again."

"Look how much damage we've done," Ashly said. "I'm sorry, but this is one accomplishment which doesn't make me very proud."

"This section of Tojolt-HI was mostly dead," Liol said. "And the sunscoop had already destroyed the tubes which still had viable life support functions."

"Ashly's right," Joshua said. "All we've done is react to events. We're in control of very little."

"I thought that's what life was," Liol said. "The honour of witnessing events. You need to be a God to control them."

"That drops us into a neat little paradox, then," Sarha said. "We have to control events if we want to find a God. But if we can control them, then ipso facto we're already gods."

"I think you'll find it's a question of scale," Joshua said. "Gods determine the outcome of large events."

"What happened here was pretty big."

"Not compared to the destiny of an entire species."

"You're taking this very seriously," Liol said.

Joshua didn't even smile. "Somebody has to. Think of the consequences."

"I'm not a total asshole, Josh. I do appreciate just how bad it's going to get if no one can find an answer to all of this."

"I was thinking what happens if we succeed, actually."

Liol's laugh was more a bark of surprise. "How can that be bad?"

"Everything changes. People don't like that. There's going to have to be sacrifices, and I don't mean just physical or financial. It's inevitable. Surely you can see that coming?"

"Maybe," Liol said gruffly.

Joshua looked over to his brother and put on his wickedest grin. "In the meantime, you've got to admit, it's a wild ride."

One of the serjeants stayed with Baulona-PWM and Quantook-LOU to act as an arbitrator as they tried to sort out the parameters of a new agreement. A triumph of optimism, she thought: that both of them believed the ZTT drive would bring about a new era among the diskcities orbiting Mastrit-PJ. It was clear that they were both conceding the remaining Tyrathca population would be evacuated to the flightship colony worlds. Their enclaves among the diskcities would not be expanded. Such a premise made it even more important that the two species didn't clash over who had claim on new star systems. Retrieving the flightship information really had become essential to the agreement. An intriguing irony. Now all she had to worry about was Quantook-LOU's sincerity. It made her suggest several safeguards to Baulona-PWM, such as ensuring communications were opened up to all the remaining enclaves. Not that either of them knew how many there were scattered among the diskcities. Quantook-LOU admitted even he didn't know how many diskcities there were.

The other serjeant accompanied a team of six breeders that Baulona-PWM had designated to reactivate their electronics. They escorted her to the band of fat towers around the end of the cylinder. It was Lalarin-MG's utilities district, with the towers housing water treatment plants, air filtration, fusion generators (appallingly crude, she thought), and the heat exchangers. Fortunately each service was provided by

parallel stations, giving it a failsoft capability. A third of the systems were inoperable, the machinery inert and tarnished, testifying as to how long it had been since Lalarin-MG had a full population.

She was taken to a tower which the breeders said was an electrical and communications station. The ground floor was occupied by three tokamaks, only one of which was working. A ramp spiralled up to the first floor. There were no windows, and the ceiling lights didn't work. Her infrared sensors showed her the silent ranks of electronic consoles, very reminiscent of those in Tanjuntic-RI. The Tyrathca had brought portable lights with them, which they set up revealing the true state of the consoles. Humidity had succoured a fur of algae over the rosette keyboards and display screens. Access panel catches had to be drilled through to release them, exposing rubbery fungal growths over the circuitry inside. The breeders had to run cables down to the generator below to power up the consoles.

One console actually burst into flames when they switched it on. Oski's curses echoed through the general communication link.

"Ask them if we can integrate our processor blocks with their network," she told Ione. "If I've got access, I'll be able to load some questors in. That should speed the process up. And while we're about it, let's see if they'll accept a little advice on reactivation procedures."

The wormhole terminus opened six hundred kilometres above Tojolt-HI's darkside, deep in the umbra. The *Stryla* flew out; Etchells was in his harpy form, red eyes blazing as he looked round in surprise. From his position the huge disk eclipsed most of the sun's surface, with a tide of crimson light appearing to sweep up over the rim, as if it was sinking into an ooze of photons.

His distortion field billowed out, probing the xenoc structure. It also clashed with another distortion field.

What are you doing here? *Oenone* asked.

Same thing as you. He found the voidhawk, three thousand kilometres away. It was next to a large hollow cylinder, a habitation station of some kind. There was another Confederation ship close by. When he focused his optical senses in their direction he saw a small glimmer of sunlight erupting through the disk directly behind them.

He quickly altered his distortion field, opening another wormhole interstice. This time he came out a hundred kilometres from the voidhawk. Red sunlight washed over his leathery scale-like feathers, and he looked down curiously at the tear in the disk. Its melted edges were radiating strongly in the infrared. The mountainous heat exchangers surrounding it were operating at their upper limit, trying to radiate away the immense thermal load imposed by overheated tubes.

“I’d say the Adamist ship used its antimatter drive to push the cylinder clear of the disk,” he told Kiera. “Nothing else could cause that kind of damage.”

“Which means they consider it important,” she said.

“I don’t see why. It’s inhabited, and very fragile. It can’t be a weapon.” His distortion field caught flocks of small chemically fuelled missiles flitting among the sharp, hot cones bristling out of the darkside. Lasers shot at them, blowing them apart in mid-flight. Over thirty radar beams from all sections of the disk were sweeping across him. One of the missiles plunged down among the heat exchange mountains, exploding. Atmospheric gas puffed out into space from the tube it shattered. “And there’s some kind of war being fought down there. Widespread by the look of it.”

“They flew all the way round the Orion Nebula, and when they get here they rip that cylinder out of a war zone,” Kiera said.

“All right, it’s important.”

“Which means it’s bad for us. Minimize your energetic effect, please.”

The hellhawk's shape rippled back to its natural profile.

Kiera's fingers typed quickly over the weapons console.

Targeting sensors locked on to the cylinder.

Disengage your weapons, now, *Oenone* ordered.

Etchells let Kiera hear the affinity voice, routing it through one of the AV pillars on the bridge.

"Why?" she asked. "What's in there?"

Several thousand unarmed Tyrathca. You would be committing butchery.

"What do you care? In fact, why are you here?"

To help.

"Very noble. And total bollocks."

Do not fire, *Oenone* appealed to Etchells. **We will defend the cylinder.**

That cylinder contains the means to destroy me, Etchells replied. **I'm quite sure of that.**

We are not barbarians. Physical destruction solves nothing.

Kiera fired four combat wasps at the cylinder.

The response from *Oenone* and *Lady Macbeth* was instant. Fifteen combat wasps launched on interception trajectories, scattering submunitions. *Lady Macbeth's* defence masers speared the incoming drones as their submunitions ejected. Two hundred and fifty fusion bombs detonated in the space of three seconds. Some pumped gamma lasers, but most were missile warheads.

Joshua absorbed the burst of sensor data disgorged by the tactical program, desperate for an overview. Visual sensors were useless against the blaze of destruction, but none of the attacking combat wasps electronic warfare submunitions had targeted *Lady Mac*—strangely negligent programming. The starship's sensors stared into the heart of the mayhem, filtering out the atomic and electromagnetic interference. Three small kinetic impacts registered against the cylinder,

along with several beam strikes. But the structure remained intact.

“Sarha, kill the bastard,” he ordered.

Five masers fired at the hellhawk. It rolled quickly and accelerated at seven gees, trying to break free from the energy strike.

Joshua fired another five combat wasps, programming them for defence minefield deployment. Their drives flared briefly, and submunitions swarmed out, forming a wide protective cluster around Lalarin-MG. If the hellhawk was serious about attacking a target outside a gravity field, its strategy would be to swallow in as close as possible, under a kilometre usually, and fire off a combat wasp salvo. Unless the target had an extensive array of SD lasers, some submunitions were bound to get through. The minefield ought to act as a temporary deterrence.

The hellhawk swallowed away.

“Syrinx, where the hell did it go?” Joshua asked.

“Standing off, two thousand kilometres.”

Oenone used the link with *Lady Mac*’s flight computer to datavise the coordinate over. Sensors locked on, showing the hellhawk holding station.

“They’ve got very strange ideas about tactics,” Joshua said. “Oski, how much longer?”

“Half an hour at least, Captain. I’ve identified probable storage areas for the almanac; none of them are active.”

“Joshua, I’m not sure the cylinder can take another attack like that,” Ione said. The serjeant mediating with Baulona-PWM and Quantook-LOU had been flung to its knees when the first chunk of shrapnel punctured the cylinder shell. A small fireball had erupted out of a tower barely a hundred yards away. The plaza shook violently as the tower disintegrated, showering the area with smoking fragments of metal and burning vegetation. When she scanned round, she saw a dozen violet contrails crisscrossing through the air, molecules

fluorescing from the gamma laser shots. Two had burned holes through the Sleeping God effigy. Her sensors hurriedly tracked along the axial gantry, but it hadn't been hit.

An automated truck trundled across the plaza, heading for the wrecked tower. Air was wailing as it was sucked down through the puncture hole. Hydraulic arms unfolded from the rear of the truck, carrying a thick metal plate. It was lowered over the hole, clanging into place. Thick brown sludge was sprayed out of a nozzle, smothering the plate. It solidified quickly, completing the seal.

"The Mosdva attack again," Baulona-PWM said.

Ione thought the breeder was going to strike Quantook-LOU.

"They didn't," she said quickly. "That was a human ship. It's from a dominion we are not allied with. The *Lady Macbeth* has fought it off."

"Do humans have dominions?" Quantook-LOU asked. "You did not tell us this."

"We didn't expect them to be here."

"Why are they here? Why have they attacked us?"

"They do not agree that Tyrathca and Mosdva should be given the faster-than-light drive. We must complete this agreement and recover the data. Then they will be unable to prevent the exchange."

"My family is working hard," Baulona-PWM said. "We keep our agreement with you, allowing you to mediate."

"And we will keep the agreement that you will be unharmed. Come now, we were deciding the message that is to be sent to other diskcity dominions." She switched back to the general communication link. "You have to get us more time."

"We'll see to it," Syrinx assured her. "Joshua, hold the fort here."

"Acknowledged." *Lady Mac's* gravitonic distortion detectors showed him the voidhawk opening a wormhole interstice.

Oenone emerged fifty kilometres from the *Stryla*. Syrinx was expecting the hellhawk to fire its lasers at them straight away. That it didn't, she took as an encouraging sign.

I'm here to talk, she said.

And I'm here to survive, Etchells replied. **We know you're here to find something you can use against us. I won't let that happen.**

Nothing will be used against you. We are trying to resolve this to everyone's benefit.

I lack your optimism.

The hellhawk launched two combat wasps.

Oenone immediately swallowed out, emerging from a terminus on the opposite side of the hellhawk from the combat wasps, twenty kilometres away. It fired ten lasers at the other's polyp hull.

Etchells swallowed away. He emerged a hundred metres above one of the diskcity's heat radiator cones. *Oenone* emerged just behind him. He'd expected that. His maser cannon fired on the voidhawk. It darted down behind the silvery cone, then curved round to shoot at Etchells.

The hellhawk accelerated at eight gees, tearing along a valley of cylindrical radiator towers. Kiera let out a muted yell of surprise and pain as she was squashed back into her acceleration couch.

"Give me fire control," Etchells told her. "You can't program the combat wasps for this scenario. I can."

"That would make me nothing," she said. "No deal. Fly us out of this."

"Fuck you." He abandoned the secondary manipulation of the distortion field, which countered the acceleration. Kiera groaned as the full eight gees rammed her down into the couch. She began channelling her energistic power to strengthen her body. Lasers raked across his hull, and Etchells looped round a glass spiral turret, pulling twelve gees. The radiator mechanisms were a constant leaden smear

to his optical senses, he was navigating by distortion field sense alone. And going too fast: the valley end was a sharp turn, almost a right angle. He swooped up above the peaks, decelerating madly as he turned. For a moment the two starships were in direct line of sight. Lasers and masers slashed across the gulf. Then Etchells dived back down into a deep gully of vertical mirror-surface dissipaters.

Oenone matched the manoeuvre and fired again. Etchells flicked from side to side, accelerating and decelerating in wild bursts. His own masers fired back. The energy beams ripped long gashes across the cliffs of dissipaters as both starships twirled and rolled. Magenta effluvium percolated out, clotting the whole valley.

Etchells shot out of the smog blizzard with cyclonic eddies rolling away from his hull. He swung round a splayed clump of black pentangular pillars, then used a mushroom-like industrial refinery to slalom again.

The way Syrinx's hands dug into the acceleration couch padding was nothing to do with the appalling gee forces washing across the bridge. The image of the craggy diskcity surface hurtling past mere metres away was shining directly into her brain. Her eyes were tight shut from reflex, and it wasn't the slightest use. There was no escape. *Oenone's* steady determination as it pursued the hellhawk prevented any censure. To doubt her love now would be selfish betrayal. She fought her own fear to bestow trust and pride.

On the other side of the bridge, Oxley was emitting a constant low moan of dismay without ever needing to draw breath.

Its resolve weakens, *Oenone* claimed buoyantly. It is slowing to turn now. We will catch it soon.

Yes. There was absolutely nothing in the tactical programs she could use to help this situation. If they rose above the artificial valleys, the hellhawk would be able to fire combat wasps straight at them. They couldn't fire back

down, one errant submunition would slaughter thousands of Mosdva. So the chase continued, which was ultimately to their advantage. It prevented the hellhawk from firing on Lalarin-MG. At a terrible cost to her nerves.

Another wormhole terminus opened a hundred kilometres above them.

Hello Etchells, Rocio said.

You? Etchells exclaimed in shock. **Shoot the shit chasing me, they've found something here that'll wipe us out.**

The *Mindori* fired three lasers at a glass cone heat exchanger a couple of kilometres ahead of Etchells. The mechanism detonated, shattering into crystalline splinters spinning inside a writhing gas cloud. Etchells screamed his fury into the affinity band and accelerated at seventeen gees, desperately trying to rise above the lethal kinetic debris. Irradiated gas streaked over the hellhawk's polyp. Energistic power flared, warding off the crystals with a ragged shield of white fire. Etchells's barrel rolled up away from the bloating indigo nimbus.

Oenone had a few extra seconds before collision. It pulled up fast, skirting the boundary of the whirling crystals. The *Stryla* was only thirty kilometres ahead of it. *Oenone*'s targeting radar locked on to the hellhawk. Then the electronic sensors warned Syrinx that the *Mindori* was targeting their hull.

Don't shoot, Rocio warned.

Kill them, Etchells demanded.

Syrinx aimed five lasers at the *Mindori*.

Etchells also targeted the other hellhawk with three masers. **Kill them now,** he said.

I won't shoot if you don't, Rocio said to Syrinx. Two of his lasers were aligned on the *Stryla*. **At least find out why we've come here first.**

So tell us, Syrinx said.

Jed and Beth were pressed against the port in the bridge, gazing in veneration at the xenoc artefact spread out below the hellhawk. There weren't many details, it was so dark, but the rim was close enough to see a silhouette of enticing geometries in the backscatter of red light. Gerald Skibbow was sitting on the acceleration couch behind the weapons console, Loren Skibbow studying the tactical displays keenly, watching the voidhawk and hellhawk rising fast from the darkside.

Traitor, Etchells spat, pushing his shaky anger behind the word.

To what, exactly? Rocio asked. **What's your crusade, Etchells? What do you care about other than yourself?**

I'm trying to stop these people from flinging us all back into the beyond. Maybe you're all for that.

Don't be absurd.

Then for fuck's sake help us wipe out that cylinder. Whatever they've come here for, it's in there.

There's no weapon in there, Syrinx said. **I've already told you that.**

Maybe I'll take a look later, Rocio said.

Shithead, Etchells raged. **I'll blow you to fucking pieces if you don't help wipe out that voidhawk.**

And that's why I'm here.

What? What are you fucking talking about?

Rocio enjoyed the irritation and confusion Etchells was emitting. **Death**, he said. **You're very keen to see others die, aren't you. You never gave Pran Soo a chance.**

You've got to be shitting me. You came after me because of her?

And Kiera. I've got someone on board who would like to see our ex-leader.

Kiera is on board? Syrinx asked.

Yes, Rocio said.

Listen you half-wit dickbrain, we're on the same

side, Etchells said. **I know the hellhawks have found another supply of nutrient fluid. That's brilliant. We're free of doing any fighting for people like Capone and Kiera. That's what I want.**

You were Kiera's number-one cheerleader. You're still doing what she wants even with the blackmail removed.

I was looking out for me. Just like you were doing for yourself. We had different methods, but we want the same thing for ourselves. That's why you've got to help us. Together we can beat those Confederation ships and destroy the cylinder.

Then what?

Then whatever we want, of course.

You don't really think we'd let you share our nutrient supply, do you? After what you've done.

You're starting to piss me off.

Jed and Beth saw the monstrous bird rise into view through the port, a jet-black shadow against the ruddy darkness of the umbra. Malevolent eyes gleamed scarlet, looking straight in at them. They backed away from the port together. To one side of the bird was another shadow, an elongated oval.

"Gerald," Jed said nervously. "Mate, there's *things* out there."

"Yes," he said. "The *Oenone* and the *Mindori*. Isn't it wonderful?" He sniffed, wiping moisture from his sunken bloodshot eyes. His voice became high again: Loren's. "She's there. And there's nowhere for the bitch to run anymore."

Jed and Beth gave each other a defeated look. Gerald was activating a lot of systems on the console.

"What are you doing?" Rocio asked.

"Bringing the remaining generators on line," Gerald an-

swered. "You can route their power into the lasers. Kill it with one shot."

"I'm not so sure that's a good idea."

"YES IT IS!" Gerald cried. "Don't you try to back out now." He clutched the edge of the console, blinking in confusion.

"Gerald?" Beth pleaded tremulously. "Please, Gerald, don't do anything rash."

Loren's face flicked up over Gerald's tortured expression. "Gerald's fine. Just fine. Don't you worry."

Beth started sobbing, clutching at Jed. His arms went round her as he stared miserably at the mad figure hunched over the console. When Skibbow had just been bonkers it'd been bad enough. This new demented combination was hell's own gatekeeper.

Loren ignored the two kids. "Rocio. Ask the voidhawk to help. It's to their advantage. We don't want any mistakes now."

"Very well." There was an edge of worry in the voice. **I have a proposition**, he said to Syrinx, on singular engagement.

Go ahead.

I have no quarrel with you, nor do I care about your mission. Etchells and Kiera threaten both of us.

Then why did you stop us from firing at them?

Because I need to capture Kiera alive. The father and mother of the body she possesses are on board. Unfortunately, they have fire authority over my combat wasps. My energistic power can disable the missiles, but the Skibbows would be able to detect my intent. There is no way of telling how they'd react; they are not a stable combination. They could choose to kamikaze; in which case I'm not sure if I could block their commands to the warheads in time.

I see. What do you suggest?

From this range, my lasers are quite capable of killing the *Stryla*'s central organ cluster in one shot. Etchells will be flung back into the beyond, and Kiera will be left intact. I will dock, and the Skibbows can deal with her.

So what do you want us to do?

Nothing. Do not interfere when I shoot. That's all I ask.

What about Kiera's control over the *Stryla*'s combat wasps?

A second laser strike will eliminate the combat wasps in their launch cradles. I can be fast. She will not have time to launch or detonate them.

You hope.

Can you provide an alternative?

Etchells spoke into the general affinity band: **Rocio, I can see you've powered up your weapon pod generators. Know this, Kiera and I have rigged my combat wasps. Any energy beam strike against me or my life-support module will result in every warhead blowing simultaneously. Both of you are well inside the lethal blast radius.**

All right, Rocio said. **We've all been real smart and blocked each other. Nobody can win now, so why don't we all just back off?**

No, Syrinx said. **If either of you accelerate away or attempt to open a wormhole interstice, I will fire. I will not give you the freedom to return to the cylinder.**

So just what the hell are we supposed to do now? Rocio demanded.

We are negotiating for the cylinder to be evacuated, Syrinx said. When all the Tyrathca have left, I will permit the three of us to retreat simultaneously. Not before. You will not slaughter innocent entities to appease your paranoia.

For fuck's sake, Etchells said. Rocio, join me, we'll blow this voidhawk to shit and stop them getting the weapon.

There is no weapon, Syrinx insisted.

I'll tell you something, Etchells, Rocio said. If it comes to a choice, I'm with Captain Syrinx.

Shithead traitor! You'd better pray their weapon works and pray real hard, because if it doesn't I will personally track you down past the end of the universe.

You won't have to chase me anywhere.

Syrinx looked over at Ruben and pouted her lips. "Maybe we should just let them go at it."

"Nice thought. I wonder what the Mosdva dominions are making of all this."

"As long as they don't start shooting at us, I don't care."

"We're getting something," Oski announced. "It's not the full almanac, but I'm accessing files with colony planet locations; they're linked to star map references."

"Can you access their star map files?" Syrinx asked.

"Loading a questor now," Oski said. "Stand by."

Syrinx and *Oenone* waited eagerly as the information began to trickle across the communication link. The first maps the questors accessed showed unknown starfields, but the third has a portion of the Orion Nebula covering a quarter of the picture. *Oenone* matched the image to the navigational plot of the nebula it had made on the voyage to Mastrit-PJ, instinctively correlating the Tyrathca coordinate formula into its own astronomical reference frame. More star maps followed, allowing the voidhawk to expand and refine the coordinate grid, correlating with recognizable star patterns. After eight minutes it could visualize a globe of space five thousand light-years across, centred on Mastrit-PJ. Tyrathca designations tagged the constellations.

Syrinx's thoughts flowed through the mental construct,

filled with quiet pride as she absorbed the detailed configuration.

It was easy, *Oenone* said modestly.

You handled it superbly, she said. **That needs to be said.**

Thank you.

Syrinx made an effort to compress her sadness. **But you do realize we probably won't get to go there.**

I understand. We need to keep the hellhawks at bay.

I'm so sorry. I know how much you wanted to go.

So did you. We must not be selfish, though. There is more at stake than our feelings. And we have explored further than anyone else.

Oh yes!

Joshua will do well.

I know. Amusement lifted her spirits. **A year ago I wouldn't have been saying that.**

It is not just you who has changed.

You always did like him, didn't you?

He was what you feared to become. Your envy became disdain. You should never be scared of what you are, Syrxinx. I will always love you.

And I you. She sighed contentedly. "Joshua, Swantic-LI found the Sleeping God at an F-class star three hundred and twenty light years from here. Coordinates coming over." She ordered the bridge processors to datavise the file over to *Lady Mac's* flight computer.

"Hey, good work, *Oenone*."

"Thank you, Joshua."

"Okay, how do you want to break up the stand-off? If I launch a combat wasp salvo from here, they'll be forced to swallow out. We can combine to protect the cylinder. Maybe we'll get lucky and they'll wipe each other out before they come back for it."

“No, Joshua. We can handle the stand-off. You take off now.”

“Jesus, you’re kidding.”

“We can’t waste the time which protecting the cylinder is going to take; it’ll be days most likely. And we certainly can’t take the risk that we might both get damaged or killed in a fight with the hellhawks. You have to leave. Once the stand-off’s over, we’ll follow.”

“That’s very cold and logical.”

“It’s very rational, Joshua. I am an Edenist after all.”

“All right. If you’re sure?”

“Who better?” She relaxed serenely on her acceleration couch, sharing *Oenone*’s perception of local space. Waiting. *Lady Macbeth*’s jump registered as a sharp twist in space-time, gone in a nanosecond.

Syrinx looked round at her crew, reaching out to them so their thoughts and regrets could mingle with hers. Sharing herself to achieve that cherished equipoise of their culture. It must have worked; for eventually she asked: “Anyone bring a pack of cards?”

27

The two friends walked together along the top of Ketton island's cliff, taking a few minutes alone together to say good-bye. Their parting would be permanent. Choma had chosen to join with Tinkerbelle, sharing that entity's voyage across eternity; while Sinon, almost uniquely among the serjeants, had decided to go back to Mortonridge.

I promised my wife I would return, that I would rejoin the multiplicity once more, he said. I will keep my word to her, for we believed in Edenism together. By doing this I will strengthen our culture. Not by much, I will be the first to admit, but my conviction in us and the path we have chosen will contribute to the overall conviction of the multiplicity and Consensus. We must believe in ourselves. To doubt now would be admitting we should never have existed.

And yet what we are doing is the pinnacle of Edenism, Choma said. By transferring ourselves into Tinkerbelle's version of the multiplicity we are evolving the human condition, moving on from our origin with confidence and wonder. This is evolution, a constant

learning curve, there is no limit to what we can find in this realm.

But you will be alone, isolated from the rest of us. What is the point of knowledge if you cannot share it? If it cannot be used to help everyone? The beyond is something the human race must face in union, we must know and accept our answer as one. If Mortonridge taught us nothing else, it was that. Towards the end I had nothing but sympathy for the possessed.

We are both right. The universe is big enough to allow us that.

It is. Though I regret what you are doing. An unusual development. I think I have become more than I was supposed to in this body. I believed such emotions would be impossible when I volunteered to join the Liberation.

Their development was inevitable, Choma said. We carry the seeds of humanity with us no matter what vessel our minds travel in. They were bound to flourish, to find their own route forward.

Then I am no longer the Sinon who emerged from the multiplicity.

No. Any sentient entity who has lived, has changed.

I will have a soul then. A new soul, one that is different to the Sinon I remember.

You do. All of us do.

Then once again I will have to die before I transfer myself back to the multiplicity. What I bring to the habitat is only such wisdom as I can muster. My soul doesn't follow my memories, so the Kiint say.

Do you fear that day?

I don't believe so. The beyond is not for everyone, knowing there is a way through, or round, as Laton claims, is enough to give me confidence. Though there is some trepidation stirring within me.

You will overcome, I am sure. Never forget it is possible to succeed. That thought alone should guide you.

I will remember.

They stopped on the crest of a mound and looked out over the island. Long lines of people were picking their way over the cracked earth, the last refugees from the buried town heading towards the cliff top where Tinkerbelle was pressed against the rock. The giant crystal's opalescent light sent ripples of gentle colour slithering over the drab ground. Air had coiled into a topaz nimbus all around it.

How apt, Sinon said. It looks as though they are walking off into the sunset.

If I have a regret, it is that I won't know how their lives finish. They will make a strange group, these souls who are going to occupy serjeant bodies, their complete humanity always beyond their grasp.

When they came out of the beyond, they claimed all they wanted was sensation again. They have that now.

But they are genderless. Not to mention sexless. They can never know love.

Physical love, perhaps. But that certainly isn't all the love there is. As with you and I, they will become whole in their own way.

I feel their disquiet already, and they haven't even reached Mortonridge yet.

They can learn to adapt to what lies ahead. The habitats will welcome them.

Nobody has ever become an Edenist against their will before. Now you have twelve thousand bewildered, angry strangers grumbling away into the general affinity band. Most of them with a cultural background that will act against easy acceptance.

With patience and kindness they will find themselves again. Think what they have been through.

At last we come to the true difference between our-

selves. I am restless and eager for the future, a voyager. You are ruled by compassion, a healer of souls. Now you see why we have to part.

Of course, and I wish you well on your splendid voyage.

Likewise. I hope you find the peace you search for.

They turned, and walked back slowly along the rocky line of the cliff. Tiny crystalline entities whisked about overhead, never pausing in one place for more than a moment. They had covered the whole island, making sure that every possessed knew there was now a way back, and what staying here meant. It was the end of Ekelund's rule. Her troops had abandoned her, banding together defiantly to walk out of Ketton. Her threats and fury only hastened their departure.

Five long queues waited before Tinkerbell's looming surface, winding through the scattered remnants of the headland camp. Two of them made up from serjeants. The remainder (and keeping their distance) were the possessed. They waited in a strange subdued mood, their anticipation and relief that the nightmare was about to end tempered by the uncertainty of what lay ahead.

Stephanie was waiting right at the tail end of the longest queue of possessed, along with Moyo, McPhee, Franklin, and Cochrane. Tina and Rana had been amongst the first through. The crystalline entities had stabilized Tina, apparently repairing the damage to her internal organs. But they all agreed the woman's body ought to be seen by human specialists as soon as possible. For herself, Stephanie decided she should be amongst the last. It was the responsibility thing again, she wanted to know everyone else was okay.

"But you're no' responsible for them," McPhee had said. "They all flocked to Ekelund's banner. It's their own bloody stupid fault they're here."

"I know, but we're the ones who tried to get Ekelund to

stop, and failed miserably.” She shrugged, knowing how feeble she sounded.

“I’ll wait with you,” Moyo said. “We’ll go through together.”

“Thank you.”

McPhee, Franklin, and Cochrane looked at each other, and said what the hell. They all joined the queue, standing behind Soi Hon. The old eco-guerrilla was in his trademark dark jungle fatigues, with his felt bush-ranger hat tilted back as if he’d just finished an arduous job. He eyed them with wry amusement and bowed to Stephanie. “I congratulate you on remaining true to your principles.”

“I don’t think it really matters, but thank you anyway.” She sat on one of the many boulders, resting her wounded hip.

“Out of all of us, it was you who achieved the most.”

“You held off the serjeants.”

“Not for long, and only to further an ideal.”

“I thought you valued ideals.”

“I do. Or I used to. That is the problem with this situation. The old ideals don’t have any relevance here. I applied them as did the political forces behind the Liberation. Both of us were very wrong. Look what we did to people, how many lives and homes we ruined. All that effort poured into conflict and destruction. I used to say I belonged to the land.”

“I’m sure you thought you did what was the right thing.”

“Indeed I did, Stephanie Ash. Unfortunately, I didn’t think enough, for it was not the right thing to do. Not at all.”

“Well hey, it don’t matter no more, man,” Cochrane said. “The fat babe’s been singing out loud for a while now. We’re like going home.” He offered Soi Hon his joint.

“No thank you. I do not wish to introduce poisons to this body. I am simply its custodian. I may soon even be held accountable for any ills I have inflicted. After all, past the end

of this queue we shall be facing them again, will we not? And we will only be equals.”

Cochrane gave him a sour look and dropped his joint, grinding it into the mud under his heel. “Yeah, right, man,” he grunted.

“What about Ekelund?” Stephanie asked. “Where’s she?”

“Back at her command post. She refused the offer to return.”

“What? She’s crazy.”

“Undoubtedly, yes. But she sincerely believes that once the serjeants have gone, then this land will be free. She intends to found her paradise here.”

Stephanie looked back at the patch of scabrous land that was Ketton.

“No,” Moyo said firmly. “She has made her own decision. And she certainly isn’t going to listen to you of all people.”

“I suppose not.”

Even at the rate of one possessed every few seconds, it took over seven hours for everyone to be repatriated. The procedure was simple enough. Where Tinkerbelle touched the cliff face, several oval tunnels had opened up, leading deep into her interior. Their walls shone with a soft aquamarine light that grew progressively brighter until it eventually filled the cleft. You just walked through, vanishing into the light.

Stephanie wasn’t the very last in. Moyo and McPhee had quietly and insistently stood behind her. She smiled in good-natured surrender and passed over the threshold. The air thickened in conjunction with the light, slowing the movement of her limbs. Eventually it felt as though she was trying to walk through the crystal itself. There was an insistent pressure exerted against every part of her. She felt the force move through her flesh, enabling her to speed up again. The aquamarine glow faded away, showing that her body had become transparent, a pattern of light conducted by crystal.

When she looked round she saw the body she'd possessed standing behind her. The woman was holding her hands up, an expression of revulsion and satisfaction straining her face.

"Choma?" Stephanie asked. "Choma, can you hear me? There's something I need to do."

"Hello, Stephanie. I thought this might happen."

Occupying a serjeant's body was the simplest thing. One waited for her, immured in crystal, completely passive with its big head bowed. It didn't matter which direction she walked in, she was always walking towards it. They merged, and it thickened around her, returning the opaque aquamarine light. The sensations were peculiar; the exoskeleton had no tactile nerves, yet it was somehow rigged to provide proof of contact. Her soles were definitely pressing down on a surface, air drifted over her as she moved forwards. The aquamarine light cleared from her eyes, allowing her to focus with remarkable clarity.

She walked out of the oval tunnel, back onto the crusty trampled-down mud of Ketton Island. The rivers of coloured light which emanated from Tinkerbelle's internal coruscations meandered over the ground. Nothing else moved.

It was a long slog back across the island to its central town. Even in the serjeant's robust body it took her an hour and a quarter. Tinkerbelle departed when she was a third of the way there, arching away above her in a opalescent blaze, then shrinking at an improbable speed. Stephanie began to pick up her pace. The air was stirring, slowly expanding again now the serjeants had gone, a gentle breeze gusting out over the edge of the cliff. Their wishes remained for a while, of course, impregnated on the fabric of this realm. But without their active presence to reinforce them, what was normality here began to return.

It was a lot brighter when Stephanie trotted up to the boundary of the town. The air had thinned considerably

now, allowing the continuum's persistent blue-white glare to shine down with unrestrained power. Every step sent her gliding a couple of metres above the ground. Gravity had reduced by about twenty per cent, she guessed.

Ekelund's headquarters were prominent at the very centre of the razed town, the big tent perched atop a mound, faintly luminous. She came out as Stephanie bounced her way up the slope, lounging against the tentpole, smiling softly.

"It's a different body, but I'd know those thoughts anywhere. I believe we've had our last goodbye, Stephanie Ash."

"You have to leave. Please. You'll destroy Angeline Gallagher's body and her soul if you stay here."

"Finally! It's not my well being you're concerned about. A small victory for me, but I consider it significant."

"Come back to Mortonridge. There are still some serjeant bodies available to host your soul. You can live a life again, a real life."

"As what? Trite little housewife and mother? Even you can't live your old life again, Stephanie."

"I never believe that a baby's future is preordained. After birth, you're on your own to make what you can from life. And we are being born again in these serjeant bodies. Make what you can of it, Ekelund. Don't kill yourself and Gallagher out of misplaced pride. Look around! The air's all but gone, the gravity's failing. There's nothing here anymore."

"I am here. This island will bloom again once it's free of your influences. We came here to this realm because it offered us the sanctuary we needed."

"For God's sake, admit you are wrong. There's no shame in it. What do you think I'm going to do, stalk you and gloat?"

"Now you get to it. Which of us was right. That's what it's always been between you and I."

"There is no right. An entire army flocked to your banner.

I had a lover and five mismatched friends. You win. Now, please, come back.”

“No.”

“Why not? At least tell me that.”

Annette Ekelund’s stubborn smile flickered. “For the first time ever, I have been me. I haven’t had to defer to anybody, to ask permission, to conform to what society expects. And I’ve lost that.” Her voice shrivelled to a hoarse whisper. “I led them here, and not one stayed. They didn’t want to stay, and I didn’t have the strength to force them.” A tear emerged from her left eye. “I was wrong. I got it *wrong*, God damn you!”

“You didn’t bring anybody here. You didn’t order us. We came because we desperately wanted to. I was a part of it, Annette. When we lay there on the mud after the harpoon strike, and the serjeants were going to throw us into zero-tau, I helped. I was so frightened that I poured every drop of my power into leaving Mortonridge behind. And I was glad when we got here. We are all to blame. All of us.”

“I organized Mortonridge’s defence. I brought about the Liberation.”

“Yes, you did, and if it hadn’t been you, it would have been someone else. It could even have been me. We’re not responsible for the way to the beyond being opened up. Ever since that began, the outcome was inevitable. You’re not to blame for fate, for the way the universe is put together. You’re not that important.”

Annette had to suck hard to fill her lungs with air. The sky had become very bright. “I was.”

“So was I. The day we took the children over the fire-break, I’d accomplished more than Richard Saldana ever had. That was how I felt. I loved it, and I wanted more of it, the way my group looked up and respected me. Typical human failing. You’re nothing special, not in that way.”

“Smug, smug, smug, God I hate you.”

Stephanie watched the dry flakes of mud lift gently from the ground, flicked up by the last wisps of air. They floated around in a lazy cloud, rebounding off each other, slowly moving higher. There was no gravity left, the only thing keeping her feet on the ground was sheer willpower. "Come with me." She had to shout, the air was all but gone. "Hate me some more."

"Would you die with me?" Annette yelled back. "Are you that fucking worthy?"

"No."

Annette yelled again. Stephanie couldn't hear her, the air had gone. **Choma, Tinkerbelle, come and get us. Quickly please.**

Annette was clawing at her throat, gulping wildly as her skin turned dark red. Her desperate motions pushed her away from the ground. Stephanie kicked off after her and grabbed a thrashing ankle. Together they tumbled away from the top of the mound. The universal white light had turned the mud fields a glaring silver; crinkled cliff tops ignited into magnesium splendour. Ketton island melted away into the glaring void.

Stephanie and Annette soared ever onwards, drowning in light.

"Are they really worth it?" someone asked.

"Are we?"

Cold aquamarine light clamped around them.

Luca didn't have to guide the horse; it simply followed the route he'd taken so many times before, plodding along without hesitation. A great circle round the middle of Cricklade estate: through the upper ford in Wryde stream, around the east side of Berrybut spinney, over Withcote ridge, taking the narrow humpback bridge below Saxby farm, the fire track through Coston wood. It gave him a good overview of his land's progress. On the surface it was as good as any pre-

vious year; the crops were later by a few weeks, but there was no harm in that. Everyone had pulled together and made up for the lost weeks following the possession.

As they bloody well ought to, by damn. I sweated blood getting Cricklade back on its feet.

And now there was enough food for everybody, the coming harvest would enable them to see the winter months out without undue hardship. Stoke County had emerged from the transition exceptionally well. There certainly wouldn't be any more marauders, not since the battle of Colsterworth station. Good news, considering the reports and rumours trickling out of Boston these days. The island's capital hadn't been so fast to embrace the old ways. Food there was becoming scarce; the farms immediately round the outskirts it were being abandoned as citizens roamed across the countryside in search of supplies.

The idiots weren't capitalising on their existing industrial infrastructure by producing goods to trade with the farming communities for food. There was so much the city could provide, basic stuff like cloth and tools. That needed to happen again, and soon. But the indications he'd got from Lionel and the other traders weren't good. Some factories were up and running, but there was no real social order in the city.

It's actually worse than when the Democratic Land Union was out on the streets, agitating for their clap-trap reforms.

Luca shook his head irritably. There were a lot of *his* thoughts roaming free these days. Some of them obvious, the ones he relied on to keep Cricklade going; others were more subtle, the comparisons, the regrets, odd mannerisms creeping back, so comfortable he could never drive them out again. Worst was that eternal junkie ache to see Louise and Genevieve again, just to know they were all right.

Are you such a monster, an anti-human, you would

deny a father that? A single glimpse of my beloved girls.

Luca put his head back and yelled: "You never loved them!" The piebald horse came to a startled halt as his voice carried across the verdant land. Anger was his last refuge of self, the one defence which Grant could never penetrate. "You treated them like cattle. They weren't even people to you, they were commodities, part of your medieval family empire, assets ready to marry off in exchange for money and power. You bastard. You don't deserve them." He shivered, crumpling down into the saddle. "Then why do I care?" he heard himself ask. "My children are the most important part of me; they carry on everything I am. And you tried to rape them. A pair of little children. Love? Do you think you know anything about it? A degenerate parasite like you."

"Leave me alone," Luca screamed out.

Shouldn't it be me asking you that?

Luca gritted his teeth, thinking about the gas Spanton used, the way Dexter had tried to make them worship the Light Bringer. Building up a fortress of anger, so his thoughts could be his again.

He tugged on the reins, wheeling the horse round so he faced Cricklade. There was little practical point to this inspection tour. He knew the condition the estate was in.

Materially they were fine. Mentally . . . the veil of contentment furled around Norfolk was souring. He recognized the particular strain of forlorn resentment accumulating over the mind's horizon. Cricklade had known it first. All across Norfolk, people were discovering what lay beneath their external perfection. The slow-maturing plague of vanity had begun to reap its victims. Hope was withering from their lives. This winter would be more than the physical cold.

Luca crossed the boundary of giant cedars and urged the horse up over the greensward towards the manor house. Just seeing its timeless grey stone façade, inset with white-

painted windows, brought a peaceful reassurance to his aching thoughts. Its history belonged to him, and so assured his future.

The girls will carry on here, will keep our home and family alive.

He bowed his head, embittered by his deteriorating will. Anger was hard to maintain over hours, let alone days. Weary, weepy dismay was no defence, and those emotions were his constant companion these days.

There was the usual scattering of activity around the manor. A circular brush ejecting a puff of soot as it rose out from the central chimney stack. Stable boys leading the horses down to graze in the east meadow. Women hanging sheets out to dry on the clothes lines. Ned Coldham—Luca couldn't remember the name of the handyman's possessor—painting the windows on the west wing, making sure the wood was protected from the coming frosts. The sound of sawing drifting out through the chapel's empty windows. Two men (claiming to be monks, though neither Luca nor Grant had ever heard of their order) were slowly repairing the damage Dexter had wrought inside.

There were more people bustling about in the walled kitchen garden at the side of the manor. Cook had brought a team of her kitchen helpers out to cut the shoots of asparagus ready for freezing. It was the fifth batch they'd collected from the geneered plant this year.

Johan was sitting beside the stone arched gateway, a blanket over his knees as he soaked up the warmth of the omnidirectional sunlight. Véronique was on a chair beside him, with baby Jeanette sleeping in a cradle, a parasol protecting her from the light.

Luca dismounted and went over to see his erstwhile deputy. "How are you feeling?" he asked.

"Not so bad, thank you, sir." Johan smiled weakly, and nodded.

“You look a lot better.” He was putting on weight again, though the loose skin around his face remained pallid.

“Soon as they gets the glass finished, I’m going to start getting some seeds set,” Johan said. “I always like a bit o’ fresh lettuce and cucumber in me sarnies during the winter. Wouldn’t mind trying to grow some avocado as well, though it’ll be next year before they fruit.”

“Jolly good, man. And how’s this little one, then?” Luca peered into the crib. He’d forgotten just how small newborn babies were.

“She’s a dream,” Véronique sighed happily. “I wish she’d sleep like this at night. Every two hours she wants feeding. You can set your clock by her. It’s really tiring.”

“Sweet little mite,” Johan said. “Reckon she’s gonna be a proper looker when she grows up.”

Véronique beamed with easy pride.

“I’m sure she will,” Luca said. It pained him to see the way the old man was looking at the baby; there was too much desperation there. Butterworth wanted confirmation that life carried on as normal here in this realm. It was an attitude that was growing among a lot of Cricklade’s residents, he’d noticed lately. The kids they were looking after had been receiving more sympathetic attention. His own resolve to stay at the estate and ignore the urge to find the girls was becoming harder to maintain. It was a weakness he could date back to the day Johan had collapsed, and then accelerating after the battle of Colsterworth station. Every step he took on the sandy gravel path around the manor seemed to press blister-sized lumps deep into the flesh of his soles, reminding him of how precarious his life had become.

Luca led his horse into the stable courtyard, guilty and glad to leave Johan behind. Carmitha was over by her caravan. She was folding up freshly washed clothes and packing them into a big brass-bound wooden trunk. Half a dozen of her old glass storage jars were standing on the cobbles, full

of leaves and flowers, their green tint turning the contents a peculiar grey colour.

She nodded politely at him. He watched her as he took the stallion's saddle off; she moved with a steady determination that discouraged interruption. Some thought had been finalized, he decided. The trunk was eventually filled, and the lid slammed down.

"Give you a hand with that?" he offered.

"Thanks."

They lifted the trunk in through the door at the back of the caravan. Luca whistled quietly. He'd never seen the inside so tidy before. There was no clutter, no clothes or towels slung about, all the pans she had hanging up were polished to a bright gleam, even the bed was made. Bottles were lined up on a high shelf, held in place by copper travelling rings.

She shoved the trunk into an alcove under the bed.

"You're going somewhere," he said.

"I'm ready to go somewhere."

"Where?"

"I've no idea. Might try Holbeach, see if any of the others made it to the caves."

He sat on the bed, suddenly very tired. "Why? You know how important you are to people here. God, Carmitha, you can't leave. Look, just tell me if someone's said or done something against you. I'll have their bloody nuts roasted very slowly over a furnace."

"Nobody's done anything yet."

"Then why?"

"I want to be ready in case this place falls apart. Because that's what'll happen if you leave."

"Oh Jesus." His head sank into his hands.

"Are you going to?"

"I don't know. I took a ride round the estate this morning to try and make up my mind."

"And?"

“I want to. I really do. I don’t know if it’ll make Grant back off, or if it’s going to be a complete surrender. I think the only reason I haven’t gone already is because he’s equally torn. Cricklade means an awful lot to him. He dreads the idea of it being left unsupervised for a whole winter. But his daughters mean more. I don’t suppose that leaves me with much choice.”

“Stop fishing for support. You always have choice. What you should ask yourself is, do you have the strength to make and sustain the decision.”

“I doubt it.”

“Humm.” She sat on the antique chair at the foot of the bed, looking at the despondent silhouette in front of her. There is no border any more, she decided, they’re merging. It’s not as fast as Véronique and Olive, but it’s happening. Another few weeks, a couple of months at the most, and they’ll be one. “Have you considered *you* might want to find the girls as well? That’s where your problem starts.”

He gave her a sharp look. “What do you mean?”

“All that decency Grant’s wicked little mind is eroding. You haven’t lost it yet, you’re still feeling guilty about Louise and what you tried to do to her. You’d like to know that she’s all right as well.”

“Maybe. I don’t know. I can’t think straight any more. Every time I speak I have to listen hard to the words to find what’s me and what’s him. There’s still a difference. Just.”

“I’m tempted to be a fatalist. If Norfolk isn’t rescued for a few decades, you’re going to die here anyway, so why not give in and live those years in peace?”

“Because I want to live them,” he whispered fiercely. “Me!”

“That’s very greedy for someone who’ll do that living in a stolen body.”

“You always hated us, didn’t you.”

“I hate what you’ve done. I don’t hate what you are. Luca

Comar and I would have got on quite well if we'd ever met, don't you think?"

"Yeah, right."

"You can't win, Luca. As long as you're alive he'll be there with you."

"I won't surrender."

"Would Luca Comar really have killed Spanton? Grant would, without hesitating."

"You don't understand. Spanton was a savage, he was going to destroy everything we are, everything we've worked to achieve here. I saw that in his heart. You can't reason with people like that. You can't educate them."

"Why do you want to achieve anything? It is possible to live off the land here. We can, us Romanies. Even Grant would be able to show you how. Which plants to eat. Where the sheep and the cattle huddle in winter. You can become a hunter, dependant on no one."

"People are more than that. We're a social species. We gather in tribes or clans, we trade. It's the fundamental of civilization."

"But you're dead, Luca. You died hundreds of years ago. This return will only ever be temporary, however it ends: in death or in the Confederation rescuing us. Why do you want to build a cosy civilization under those circumstances? Why not live fast and stop worrying about tomorrow?"

"Because that's not what I am! I can't do that!"

"Who can't? Who are you that wants a future?"

"I don't know." He started sobbing. "I don't know who I am."

There were fewer people in Fort Forward's Ops Room these days, a barometer of the Liberation's progress and nature. The massive coordination effort required for the initial assault was long gone. After that, the busiest time had been following the disastrous attack on Ketton when they had to change the front

line assault pattern, splitting Mortonridge into confinement zones. It was a strategy which had worked well enough. There certainly hadn't been any more Kettons. The possessed had been divided up, then divided again as the confinement zones were broken down into smaller fractions.

From his office, Ralph could look out directly at the big status screen on the wall opposite. For days after Ketton he'd sat behind his desk watching the red icons of the front line change shape into a rough grid of squares stretched over Mortonridge. Each square had gone on to fission into a dozen smaller squares, which became rings and then stopped contracting. The sieges had begun, 716 of them.

It left the Ops Room with supervising the mopping-up operation across open land. The Liberation command's main activity was now managing logistics, coordinating the supply routes to each siege camp and evacuating the recovered victims. All of which were handled by different, secondary, departments.

"We're redundant," Ralph told Janne Palmer. She and Acacia had stayed behind after the early-morning senior staff meeting. They often did, having coffee together and bringing up points which didn't quite warrant the attention of a full staff meeting. "There's no fighting left," he said. "No bad decisions that I have to take the blame for. This is all about numbers now, statistics and averages. How long it takes the possessed to finish eating their supplies, balancing our medical resources and transport facilities. We should just turn it over to the accountants and leave."

"I've not known many generals to be so bitter about their victories," Janne said. "We won, Ralph, you were so successful that the Liberation has become a smooth operation where no one is shooting at us."

He gave Acacia a quizzical look. "Would you describe it as smooth?"

“Progress has been smooth, General. Individuals have of course suffered considerable hardship out on the front line.”

“And on the other side as well. Have you been monitoring the state of the possessed we’re capturing when those sieges fail?”

“I’ve seen them,” Janne said.

“The possessed don’t actually surrender, you know. They just become so weak the serjeants can walk in unopposed. We broke twenty-three sieges yesterday, that produced seventy-three dead bodies. They just won’t give themselves up. And the remainder—Christ, cancer and malnutrition is a bad combination. Once we’d put them through zero-tau, seven actually died on the emergency evac flight back to Fort Forward.”

“I believe there are now enough colonizer ships in orbit to cope with the casualty rate,” Acacia said.

“We can store them in the zero-tau berths,” Ralph said. “I’m not so sure about treating them. They may wind up waiting in stasis for quite a while until there’s a hospital place for them. And that’s even with all the help we’re getting from Edenist habitats and our allies. Dear God, can you imagine what it’ll be like if we ever manage to haul an entire planet back from wherever it is they vanish them away to?”

“I believe the Assembly President had asked the Kiint ambassador for material aid,” Acacia said. “Roulor said that his government would look favourably to helping us with any physical event which was beyond our industrial or technical ability to cope with.”

“And Ombey’s medical situation doesn’t count as a crisis?” Janne asked.

“Treating the de-possessed from Mortonridge is not beyond the Confederation’s overall medical capability. That would seem to be the criteria the Kiint have set.”

“It might be physically possible, but what government is

going to let a ship full of ex-possessed into their star system, let alone parcel them out among civilian hospitals in the cities?"

"Human politics," Ralph grunted. "The envy of the galaxy."

"That's paranoia, not politics," Janne said.

"It translates into votes, which makes it politics." The Ops Room computer datavised a stream of information into Ralph's neural nanonics. He glanced through the window to see one of the red rings up on the status screen turn a deep mauve. "Another siege over. Town called Wellow."

"Yes," Acacia said. Her eyes were shut as she eavesdropped on the serjeants actually ringing the clutter of sodden, mashed-up buildings. "The ELINT blocks monitoring its energistic field reported a massive decline. The serjeants are moving in."

Ralph checked the AI's administration procedures. Transport was being readied, with a flight of Stonys being assigned to the camp. Fort Forward medical facilities were notified. It even estimated the number of zero-tau berths they'd need on the orbiting colonizer starships, basing it on the last SD sensor satellite's infrared sweep. "I almost wish it was the same as the first day," Ralph said. "I know the possessed put up a hell of a fight, but at least they were healthy. I was ready for the horrors of war, I was even coping with sending our troops into action knowing they'd take casualties. But this isn't what I expected at all, this isn't saving them any more. It's just political expediency."

"Have you told the Princess that?" Acacia asked.

"Yes. She even agreed. But she won't allow me to stop it. We have to clear them out, that's the only consideration. The political cost outweighs the human one."

The rover reporters assigned to the Liberation were all billeted in a pair of three-storey programmable silicon barracks

on the western side of Fort Forward, near the administration and headquarters section. Nobody minded that, it placed them close to an officers' mess, which at least allowed them to get a drink in the evening. But as far as providing them with an authentic experience of troop quarters went, you could take realism too far. The ground floor was a single open space that was intended as a general recreation and assembly hall, with a total furniture complement of fifty plastic chairs, three tables, a commercial-sized induction oven and a water fountain. It did at least have a high-capacity net processor installed for them to stay in touch with their studio chiefs. Beds were upstairs, in six dormitories with a communal bathroom on each floor. For a breed used to four-star (minimum) hotels, they didn't acclimatize well.

The rain started at eight o'clock in the morning while Tim Beard was downstairs having breakfast. There were three choices for breakfast at Fort Forward: tray A, tray B, and tray C. He always tried to get down in time to grab a tray A from the pile by the door, which was the most filling, so he didn't have to eat lunch; trays D, E, and F violated all kinds of human rights declarations.

He pushed the tray into its slot in the oven and set the timer for thirty seconds. Drizzle pattered down in the big open doorway. Tim groaned in dismay. It would make the humidity hellish for the rest of the day, and if he travelled down into Mortonridge itself he'd have to use the anti-fungal gel that evening—again. Another day in the clutches of decay, watching a decaying Liberation. The oven beeped and ejected his tray. The wrapping had split, mixing his porridge with his tomatoes.

There were a couple of chairs left at one of the tables. He sat down next to Donrell, from News Galactic, nodding at Hugh Rosler, Elizabeth Mitchell, and the others.

"Anyone know where we're cleared for today?" he asked.

"Official Stonys are taking us down to Monkscliff," Hugh

said. "They want to show us some medical team just in from Jerusalem, got a new method of cramming protein back into the malnutrition cases. Direct blood supplement, slam protein back into your cells. Hundred per cent survival rate. It's going to be real useful when the last sieges end."

"I want to try and get back down to Chainbridge," Tim said. "The army set up a big field hospital there. There's been some Gimmie suicides. They couldn't handle being saved."

"Gimmie the winning side," Elizabeth muttered. "God damn typical, or what?"

"No," Donrell said complacently. He smiled round at his colleagues. "You don't want any of that, you want to visit Urswick."

Tim hated the smug tone, but Donrell was one of the best at ferreting information. A neural nanonics check told him Urswick was a siege town that had been liberated yesterday afternoon. "Any reason?"

Donrell grinned and made a show of lowering a triangle of toast into his mouth. "They ran out of food over a week ago. That means they had to eat something different to last out so long." He licked his lips.

"Oh Jesus," Tim winced. He shoved his breakfast tray away. But it would make one fantastic story.

"Who the hell told you that?" Elizabeth asked; there was a disturbing eagerness in her voice.

Tim was preparing a disapproving look for her when he saw Hugh look up suddenly.

"One of the mercs I know," Donrell said. "She had a buddy in the Urswick support troop. At the start of the siege the infrared sweep showed a hundred and five people in there. The serjeants liberated ninety-three."

Hugh was glancing round the hall, frowning, as if his name was being called.

"Could be some of your basket cases, Tim," Elizabeth suggested. "They couldn't handle the memory."

Hugh Rosler stood up and walked towards the open door. Donrell gave a rough laugh. "Hey, Hugh, you want some of my sausage? Tastes kinda strange."

Tim gave him an annoyed look, and hurried off after Hugh.

"Something I said?" Donrell shouted after them. The whole table was chuckling.

Tim caught up with Hugh just outside. He was ignoring the rain, walking purposefully across the mesh road.

"What is it?" Tim asked. "You know something, don't you? One of your local contacts datavise you?"

Hugh gave Tim a slight sideways smile. "Not quite, no."

Tim scampered along at his side. "Is it hot? Come on, Hugh! I pool, don't I? Your best sensevises are down to me."

"I think you just got your story back." Hugh slowed, then turned quickly and started jogging along the gap between a couple of barracks.

"Christ's sake," Tim muttered. He was soaking, but nothing would make him give up now. Hugh might be a provincial hick working for a nothing agency, but he was always on the level.

There was a four-lane motorway on the other side of the barracks, with a junction right in front of them. Two loops of mesh road led round to one of Fort Forward's hospitals. Hugh hurried out onto the motorway, right in front of an automated ten-tonne truck.

"Hugh!" Tim screamed.

Hugh Rosler didn't even look at the truck. He held up a hand and clicked his fingers.

The truck stopped.

Tim gaped, not believing. It didn't brake. It didn't skid to a halt. It just stopped. Dead. In the middle of the road. Fifty kilometres an hour to zero in an instant.

"Oh mother of God," Tim croaked. "You're one of them."

"No I'm not," Hugh said. "I'm the same as you, I'm a re-

porter. It's just that I've been doing it a lot longer. You pick a few useful things up."

"But . . ." Tim hung back on the edge of the motorway. All of the traffic was slowing to a halt, red hazard strobes flashing brightly.

"Come on," Hugh said cheerfully. "Trust me, you don't want to miss this. Start recording."

Tim belatedly opened a neural nanonics memory cell. He stepped out onto the motorway. "Hugh? How did you do that, Hugh?"

"Transferred the inertia through hyperspace. Don't worry about it."

"Fine." Tim froze. A glimmer of emerald light was shining in the air behind Hugh. He gurgled a warning and raised his hand to point.

Hugh turned to face the light, smiling broadly. It expanded rapidly to a pillar five metres wide, twenty tall. Raindrops sparkled as they fell around it, acquiring their own verdure corona.

"What is that?" Tim asked, too fascinated to be frightened.

"Some sort of gateway. I don't actually understand its compositional dynamic, which is pretty remarkable in itself."

Tim gathered up his reporter's discipline and focused on the cold light in front of him. There were shadows moving deep inside. They grew larger, more distinct. A serjeant stepped out onto the glistening road. Tim upped his sensorium reception, waiting in awe.

"Urgh," the puissant serjeant exclaimed in a shrill voice. "What a simply awful homecoming, darling. It's absolutely weeing down."

Ralph got out to one of the seven emerald gateways ninety minutes after they opened. The between time was a frantic rush to make sense of what was happening and respond ap-

propriately. It saw the Ops Room brought back to full strength as officers ran in from all over the building to take up their stations.

That the radiant green columns were some form of wormholes was easy enough to establish. The exact status of the people walking out of them was more problematical.

“The serjeants do not contain Edenist personalities,” Aca-cia exclaimed. “General affinity is a babble of voices, they declaim without adherence to simple convention. Clarity has become impossible.”

“Then who are they?”

“I believe they are ex-possessors.”

By then several serjeants with their original Edenist personalities had come through the gateways, helping to clarify the situation, telling every Edenist in or orbiting Ombey that they were the refugees from Ketton island. Even so, Ralph activated the incursion strategy, drawn up in the weeks preceding the liberation in case a wild foray by the possessed penetrated Fort Forward’s perimeter. All ground and air traffic across the camp was shut down, all personnel confined to barracks. Duty marines were rushed to the gateways. The one thing he had to confirm was that the possessors now in serjeant bodies hadn’t retained their energetic power. Once that was proven, he allowed the full-alert status to drop a level. Both he and Admiral Farquar agreed that the SD platforms would continue targeting the gateways. They might be benign now, but who was to say that would last.

For all its strangeness, the situation was a problem of logistics again. The humans who came staggering out of the gateways were in the same kind of physical condition as every other ex-possessed, badly in need of medical treatment and decent food. It couldn’t be coincidence that each gateway had opened just outside a hospital; but their numbers and rate of arrival were putting a severe strain on the immediate medical resources.

As to the serjeants, the one contingency Ralph and his staff had never planned for was acquiring over twelve thousand ex-possessors in non-threatening guise. Ralph initially classified them as prisoners of war, and the AI reassigned three empty blocks of barracks as their accommodation. Marines and mercenaries on leave at the camp were formed into guard squads, confining them to the buildings.

It was a stall manoeuvre; Ralph didn't know what else to do with them. They had to be guilty of more than just being in the enemy army. Other charges would have to be brought, surely? Kidnap and grievous bodily harm, at least. And yet, they were the victims of circumstance—as any lawyer would be bound to argue.

But just for once, the problem of what to do with them afterwards wouldn't be his. He didn't envy Princess Kirsten that decision.

Dean and Will reported to the Ops Room to act as Ralph's escort when he was finally ready for his inspection. The closest gateway was less than a kilometre from the headquarters building itself. Even with the marine squads orchestrated by the AI, the area around it was predictably chaotic. Huge crowds of spectators from all over the camp, including every rover reporter, milled round the gateways to snatch a byte of the action. Dean and Will had to elbow people aside to let Ralph through. At least some degree of order had been established by the time they reached the gateway. The marine captain in charge had established a hundred-metre perimeter. Inside that, marines were deployed to form two distinct passages to shepherd the returnees away. One led back to the nearby hospital entrance, the other finished up at the parking lot, where trucks waited to drive serjeants away to their detention centres. As soon as a figure walked out of the shimmering green light, an assessment team decided which passage they were destined for, a decision backed up by nervejam sticks. All protests were simply ignored.

“Even our remaining original serjeants are going to the detention barracks,” Acacia told Ralph as they shoved their way through the perimeter. “It makes things easier. We can sort them out from the ex-possessors later on.”

“Tell them, thanks. I appreciate it. We need to keep things flowing here.”

The marine captain squelched over to Ralph’s little group and saluted. Rainwater dripped steadily off his skull helmet.

“How’s it going, Captain?” Ralph asked.

“Good, sir. We’ve got a valid supervision routine up and running here now.”

“Well done. You get back, do your job. We’ll try not to get in the way.”

“Thank you, sir.”

Ralph spent a couple of minutes watching quietly as the people and serjeants came flooding out of the green light. Despite the humidity and warm rain, he felt cold trickling through his chest.

Strange, I can accept a wormhole or ZTT jump across light-years as perfectly normal, but a portal leading out of this universe is like a phobia. Is this too *divine* for me, physical proof of a realm where celestials exist? Or the opposite, proof that even the human soul and omnipotent creatures have a rational basis? I’m looking at the end of religions, the fact that we were never visited by any messenger from any creator god. A fact presented in a fashion I can never ignore. The loss of our race’s spiritual innocence.

He could see that the ex-possessed humans that came through were surprised, a dim-witted confusion present on every face as the dreary rain started to soak their clothes. The serjeants lumbered out, their bewilderment less obtrusive, but none of them seemed in full control of their moments during the initial few moments.

Several members of the science investigatory team were wandering round the gateway, waving sensor blocks at it.

Most of the army's scientific staff were down on the peninsula, trying to make sense of the energistic ability. Diana Tiernan was one of the few people content with the sieges, explaining how it gave the physicists a chance to study the power outside the laboratory. Ralph had left her back in the headquarters building, desperately trying to arrange for instruments and personnel to be flown back to Fort Forward.

"That's Sinon," Acacia exclaimed. "He's an original."

Ralph saw a serjeant who lacked the unsteadiness of the others. The assessment team of marines and medics pointed him at the passage of armoured marine troopers. "You sure?" Ralph queried.

"Yes."

Ralph hurried up to the assessment team. "Okay, we'll take this one."

The marine captain's exasperation was throttled back at the interference. "Yes sir."

A thoroughly chastised Ralph led Sinon away. They wound up standing between the gateway and the perimeter ring of marines. His own staff gathered round. "This crystal entity you encountered back there, did it tell you how we could solve the overall problem?" Ralph asked.

"I'm sorry, General. It took the same attitude as the Kiint. We must generate our own solution."

"Damnit! But it was willing to help de-possess bodies."

"Yes. It said it judged us by our own ethics, and that such a theft was wrong."

"Okay, what kind of conditions were you facing in that realm? Did you see any of the other planets?"

"The conditions were what we made of them; the reality dysfunction ability was paramount. Unfortunately, even wishes have limits. We were cast out alone on that island, without any fresh air or food. Nothing could change that. The entity implied that our planets would be considerably more fortunate, not that we saw any. That realm is too vast

for any chance encounter. The entity even hinted it may be more extensive than our own universe, though not necessarily in its physical dimensions. It is an explorer, it went there because it believed it would expand its own knowledge.”

“So it’s not paradise?”

“Definitely not. The possessed are wrong about that. It’s a refuge, that’s all. There’s nothing there which you don’t bring to it yourself.”

“So it is entirely natural?”

“I believe so, yes.”

After the burst of confusion at the start of the exodus, the marines exerted complete control over everyone who came through the gateways. They were on top of the situation, and stayed there right up until the last four serjeants came through. The marines immediately ushered them towards the trucks waiting in the parking lot as they’d done with all the others.

“No way,” Moyo said. “We’re waiting for her.”

“Who?” the marine captain asked.

“Stephanie. She must have gone back somehow.”

“Sorry, no exceptions.”

“Yo, dude,” Cochrane said. “She’s like our righteous leader; and she’s doing her last good deed. So where do you cats come off acting like colonel asswipe?”

The captain wanted to protest, but somehow the sight of a serjeant wearing slim purple sunglasses and a paisley-patterned backpack stopped the words from coming out.

“I mean, she’s like out there all alone battling the last and greatest of the hobgoblin queens, to save *your* soul. The least you can do is act thankful.”

“It’s closing,” McPhee shouted.

The gateway was contracting, shrinking back to a small sliver of emerald shimmering a metre above the surface of the road. The physicists shouted excitedly, datavising fresh

instructions to the considerable sensor array they'd assembled round the transplanetary rift.

"Stephanie!" Moyo yelled.

"Wait," Cochrane said. "It's not shutting down completely. See?"

A small remnant of green light continued to burn steadily.

"She's still there," Moyo said desperately. "She can still make it. Please!" he appealed to the marine captain. "You have to let us wait for her."

"I can't."

"Hang on in there," Cochrane said. "I maybe know someone who can help here." Ever since he'd arrived back on Ombey there had been a thousand alien voices whispering away to each other at the back of his mind. **Sinon**, he yelled at them. **Hey, big dude, you around these parts? It's me, your ol' buddy Cochrane. We like need some high-powered help right now. Stephanie's being cosmically stupid again.**

Acacia took the problem directly to Ralph. He might have been firm about it, but the Edenist mentioned Annette Ekelund.

"Let them wait," Ralph datavised to the marine captain. "We'll set up a watching brief."

An hour and twenty minutes later the gateway expanded briefly to let three humanoid figures stagger out. Stephanie and Annette, in their serjeant bodies, supported a trembling Angeline Gallagher between them. They handed her over to the small medical team, who rushed her into the hospital.

Moyo raced over and flung his arms around Stephanie, his mind leaking a torrent of distress into the general affinity band.

"I thought I'd lost you," he cried. "After all that, I couldn't stand it."

"I'm sorry," she said. A physical embrace was almost im-

possible, their hard skulls *clacked* together loudly as they attempted to kiss.

The rover reporters who'd hung on to the bitter end dodged round the marine guard to close on the strange party.

"Hi there you dudes, I'm Cochrane, one of the like superheroes who got the kids out across the firebreak. That's Cochrane. C-O-C-H . . ."

It was quiet in the detention barracks. Not that the serjeants slept, they didn't need to. They were lying on their bunks or walking round the hall downstairs, being interviewed by the rovers, catching up on AV news shows (mainly featuring themselves). Most of all, they were getting used to the fact they were back in genuine bodies, and owned them one hundred per cent. Apprehension and marvel at their latest turn in fortune had left them stupefied.

Ralph walked through one of the barracks, escorted by a watchful Dean and Will. The marine guard was allowing the serjeants to move around freely, all except one. There were five armed troopers standing outside the door to the office the bitek construct was secured in. Two stood to attention as Ralph approached, the others kept focused on their job.

"Open the door," Ralph ordered.

Dean and Will came in with him, expressions informing any serjeant they'd love it to try taking them on. It was read by the room's sole occupant, who was sitting passively behind a table. Ralph sat down opposite.

"Hello, Annette."

"Ralph Hiltch. General, sir. You are becoming a depressing recurrent feature in my life."

"Yes. And it is a life now, isn't it? How does that feel, coming back from the dead as a real person?"

"This is what I always wanted. So I can't complain. Though I expect I'll eventually become ungrateful about the lack of this body's sexuality."

“You’ll be even more unhappy if I fail, and the possessed come marching over the horizon to capture your fine new body for a lost soul to host.”

“Don’t be so modest. You won’t fail here on Ombey, Ralph. You’re too good at your job. You love it. How many sieges are left now?”

“Five hundred and thirty-two.”

“And falling, I believe. That was a good strategy, Ralph. A good response to Ketton. But I still would have loved to see your face when we took that chunk of landscape out from under your nose.”

“Where did that stunt get you? What did you achieve?”

“I got a body, didn’t I. I’m alive again.”

“Only by chance. And you didn’t help a lot from what I hear.”

“Yes yes, Saint bloody Stephanie the hero of the flying isle. Is the Pope going to give her an audience? I’d like to see that, a bitek abomination with a soul that’s escaped from purgatory having tea at the Vatican.”

“No. The Pope’s not seeing anybody anymore. Earth is falling to possession.”

“Shit! Are you serious?”

“Yes. Last I heard, there were four arcologies infested. It might even have fallen by now. So you see, I won, but you were right after all. This will never be decided here.”

The serjeant sat up straighter, its recessed eyes never moving from Ralph. “You look tired, General. This Liberation is really wearing you down, isn’t it?”

“You and I both know there is no paradise now, no immortality. The possessed can never have what they wanted. What will they do, Annette? What will happen to Earth when it arrives in that sanctuary realm and none of their food synthesis machinery works? What then?”

“They’ll die. Permanently. Their suffering will end.”

“Is that what you’d call a final settlement? Problem over.”

“No. I had that opportunity. I didn’t take it.”

“The beyond is preferable to death?”

“I’m back, aren’t I? Would you prefer me to be on my knees?”

“I’m not here to gloat, Annette.”

“Then what are you here for?”

“I am the supreme commander of the Liberation forces. For the moment that gives me an extraordinary degree of power, and not just in military terms. You tell me if there’s any point to my being here. Can this be settled on Mortonridge, or has everything we’ve both endured all been for nothing?”

“You’re in charge of a weary army facing a dying enemy, Ralph; that’s not a platform for revolution. You’re still trying to validate your glorious war by searching for a noble conclusion. There is none. We are a sideshow. An incredibly expensive, fabulously dramatic entertainment for the accessing masses. We distracted their attention while the real men and women of power decided what our fate was going to be. Political policies determine how the human race confronts this crisis. War doesn’t have that ability. War has only one outcome. War is stupid, Ralph. It is the desecration of the human spirit, martyring yourself for someone else’s dream. It is for people who do not believe in themselves. It is for you, Ralph.”

The security level one sensenviron conference room never changed. Princess Kirsten was already seated at one end of the oval table as the image of white nothingness walls formed around Ralph, seating him at the other end. Nobody else was present.

“Well, what a day,” Kirsten said. “Not only do we get all our people back safely, we wind up with fewer lost souls to plague the living.”

“I want to stop it,” Ralph said. “We’ve won. What we’re doing now has become utterly pointless.”

“There are still over quarter of a million possessed on my planet. My subjects are their victims. I don’t think it’s over.”

“We have them confined. As a threat they’ve been neutralized. Of course we’ll maintain their isolation, but I’m asking that we stop the actual conflict.”

“Ralph, this was your idea. The sieges have stopped all the shooting.”

“And replaced them with Urswick. Is that what you want, your subjects eating each other?”

The image of the Princess showed no emotional response. “The longer they remain possessed, the bigger their cancers grow. Those bodies will die unless we actively intervene and rescue them.”

“Ma’am, I am going to issue an order that food and basic medical supplies are handed over to the possessed currently under siege. I will not rescind it. If you do not want it issued, then you will have to relieve me of my duty.”

“Ralph, what the hell is this? We’re winning. Forty-three sieges collapsed today. Another ten days, a fortnight at the most, and it’ll all be over.”

“It is over here, ma’am. Persecuting the possessed that remain is . . . disgusting. You listened to me before—God, that’s how this whole thing began. Please give the same consideration to what I’m saying now.”

“You’re saying nothing, Ralph. This is a media war, a propaganda exercise, that’s what it always was. With your cooperation, I might add. We must have total victory.”

“We already have it. This is more. We found out today that it’s possible to open a gateway to the realm where the possessed flee to. Nobody understands it, the physics behind it; but we know it’s possible now. We will be able to replicate the effect ourselves some day. The possessed can’t hide away from us any more. That’s our victory. We can make

them face up to what they are, what their limits are. That way we can go on to find a solution.”

“Expand that for me.”

“We now have the power of life and death over the possessed under siege, especially now the Confederation navy is working on anti-memory. By concluding the sieges with their capitulation, we’re wasting our position, our tactical advantage. Ekelund said this crisis will never be decided here on Ombey, by us. I used to believe her. But today changed that. We are in a unique position to force the possessed to cooperate and help us find a solution. There *is* a solution—the Kiint found one, the crystal entities found one, we even think the Laymil found one—not that mass suicide would be valid for humans. So give the remaining possessed food, let them recover, and then start negotiating. We can use the Ketton island veterans to go in and open up a dialogue for us.”

“You mean the serjeants, the ex-possessors?”

“Who better. They have first-hand experience that the sanctuary realm is nothing of the sort. If anybody can convince them, those serjeants can.”

“Good God. First you want the kingdom to adopt bitek, now you’d have me allied with the lost souls themselves.”

“We know what being antagonistic to them brings us. A fifth of a continent devastated, thousands of deaths, hundreds of thousands of cancer victims. This has been suffering on a scale we’ve not had since the Garissa genocide. Make it mean something, ma’am, make some good come out of it. If it’s possible, if there is the slightest chance that this might work, you cannot ignore it.”

“Ralph, you are going to be the death of my senior advisors.”

“Then they can come back from the beyond and persecute me. Am I free to give the order?”

“If any of these possessed use this as an opportunity to try and break out, I want them in zero-tau within a day.”

“Understood.”

“Very well, General Hiltch, give your order.”

Al had moved to a suite a couple of floors up the Hilton where all the utilities still worked. The doctors needed a reliable electrical supply, fancy phone lines, clean air, that kind of crap. They'd turned the new suite's bedroom into a treatment room, raiding Monterey's hospital for equipment and medical packages. More stuff had been flown up from San Angeles. Stuff that gave Al the creeps: bits of other people, living organs and muscles and veins and skin. Emmet had run a planet-wide search for a pair of compatible eyes, eventually tracking them down to a storage vault in Sunset Island. A priority flight had brought them up to Monterey.

The doctors said it was going well. Jez was out of danger. They'd replaced her blood and grafted on skin and tissue where Kiera had burned down to the bone, implanted the new eyes. Once the operations were over, they'd covered her in medical packages. Now it was just a question of time until she healed over, they'd assured him.

They didn't like Al visiting too much. Jez looked so helpless smothered in that green plastic substance he got all worked up, which screwed up the packages. So he didn't get too near, just hung out by the door and watched over her. Like a guy should do for his dame. It gave him time to think a lot.

Mickey, Emmet, and Patricia came into the suite's lounge. Al had one of the stewards hand round drinks as they sat round the low brass and marble table, then ordered everyone else out of the room.

“Okay, Emmet, how long till they get here?”

“I figure some time in the next ten hours, Al.”

“Fair enough.” Al lit a Havana and blew a long trail of

smoke at the high ceiling. "On the level, can we fight them off?"

Emmet took a sip of the bourbon and replaced the glass on the table, studying it keenly. "No, Al, we're going to lose. Even if they only use the same level of force as they did against Arnstat, we'll lose. And they'll be carrying enough combat wasps to fire two or three times as many at us. Everything in orbit above New California will be wiped out. The ships can jump away. But they've got nowhere to go except for the last couple of planets we infiltrated. And I'm not too sure they'll even manage that. We think the Navy's void-hawks pursued a lot of our guys from Arnstat and blew them up after they'd jumped away. There weren't too many made it back here."

"Thanks, Emmet, I appreciate you being straight with me. Mickey, Patricia, what's the word among the soldiers?"

"They're getting jumpy, Al," Patricia said. "No two ways about it. There's been enough time for what that bitch Kiera said to start registering. The Organization's put us on top, but that makes us a target. We know we can't take over another planet again, New California is all we've got. A lot of them want to go down there."

"But we're holding them, Al," Mickey said. His nervous tic was palpitating away. "I don't take no shit from any of my people. They're loyal. You made us, Al, we'll stay with you."

His blind enthusiasm made Al smile faintly. "I ain't asking no one to commit suicide for me, Mickey. They wouldn't do it anyway; they all came out of the beyond, remember. They ain't gonna go back just because I ask nice. Party's over, guys. We had fun for a while, but we've reached the end of the road. I got a bum rap from history once, I ain't having that again. This time people are gonna say I did the best for everyone. They're gonna show me some genuine respect."

“How?” Patricia asked.

“Because we’re going out in style. It’s gonna be me who stops the slaughter. I’m gonna make the Navy an offer they can’t refuse.”

The *Ilex* was one of the voidhawks who had taken up an observation position two million kilometres out from New California in the wake of the mass hellhawk defection from the Organization. The Yosemite Consensus had soon found out about Almaden. Hellhawks had been delivering non-possessed survivors to the habitats, a repatriation deal for rebuilding the asteroid’s nutrient refinery, they said. Consensus hadn’t finished reviewing the implications of that yet; it seemed unlikely that they could maintain the machinery for more than a few years. However, that the hellhawks so actively sought to avoid combat was a particularly welcome development. Capone’s actual motives for allowing and even assisting such an action were highly questionable.

Whatever the true reason, it left Yosemite with an excellent opportunity to re-establish its observation of New California and the Organization fleet. *Ilex* had been assigned to review the low-orbit SD network in preparation for the arrival of Admiral Kolhammer’s attack force. They deployed their spyglobes and waited for them to complete the long fall down below geostationary orbit. There was still an hour to go before the little sensors started to return useful data when a communication beam from Monterey was aligned on them.

“I wanna talk to the captain,” Al Capone said.

Auster immediately informed the Yosemite habitats. Their Consensus came together, reviewing the situation through his eyes and ears. “This is Captain Auster. What can I do for you, Mr Capone?”

Al grinned, and turned to someone out of view. “Hey, you

got that on the dime, they're as prissy as the Limeys. Okay, Auster, we all reckon that the Navy is due here any minute now. Right?"

"I can neither confirm nor deny such an event."

"Bullshit, they're on their way."

"What do you want, Mr Capone?"

"I need to talk to the guy in charge, the admiral. And I need to do that before he starts shooting. Can you fix that for me?"

"What do you wish to talk to him about?"

"Hey, that's between me and him, pal. Now can you set that up, or do you wanna sit back and let a whole load of people get slaughtered? I thought that was against your religion or something."

"I'll see what I can do."

Illustrious emerged in the centre of the voidhawk defence sphere formation, 300,000 kilometres above New California. Admiral Kolhammer waited impatiently for the tactical display, cursing the delay while the warship's sensors deployed.

Lieutenant Commander Kynea, the voidhawk liaison staff leader, called out: "Sir, local voidhawks have received a communications request. Al Capone wants to talk to you."

It wasn't something Motela Kolhammer was expecting, but the probability was always there. Capone didn't have to be a genius to work out where the attack force was heading after Arnstat.

The tactical display was coming on line, supplemented by information from the Yosemite voidhawks. The news that the hellhawks had departed was extremely welcome. Though even without them New California had a prodigious defence network; its strength had determined the ultimate size of the attack force. So far, none of the platforms had fired.

"I'll listen to him," Kolhammer said. "But I want our deployment to continue as planned."

"Aye, sir."

The *Illustrious* aligned one of its communication dishes on Monterey.

"So you're the admiral, huh?" Al Capone asked once the link was established.

"Admiral Kolhammer, Confederation Navy. Currently commanding the attack force emerging above New California."

"I guess I must have frightened you people, huh?"

"Guess again."

"I don't think so. I got it right first time, pal. There's one fuck of a lot of you. That means you're running scared."

"Interpret our emergence how you choose. It is of no relevance to me. Did you wish to surrender?"

"Blunt son of a bitch, ain't you?"

"I've been called many things, that's one of the milder observations."

"You killed a lot of people on Arnstat, Admiral."

"No. You did. You backed us into a position where we had no alternative but to respond appropriately."

Al grinned brightly. "Like I said, I frightened you. That's a big tough decision your Assembly must have made, sacrifice an entire planet just to whack me. Taxpayers ain't gonna like that, no sir. You're supposed to be protecting them. That's your duty."

"I'm very aware of my duty to the Confederation, Mr Capone. I don't need you to tell me that."

"Have it whatever way you want. Thing is, I've got an offer for you."

"Go ahead."

"You're gonna shoot off a shitload of artillery at us, right. I mean, it's gonna be like the fucking Alamo in here."

"You'll discover my intentions soon enough."

“We’ve got over a million people up here, more if you count all us poor lost souls; but certainly a million flesh-and-blood bodies. Plenty of women and children, too. I can prove that; there’s stuff my technical guys can send you, lists and records and such. Do you really want to kill them all?”

“No, I do not wish to kill anybody.”

“That’s good, we can talk about that.”

“Talk quickly.”

“Pretty simple; I ain’t gonna jive-ass you. You’ve already decided you’ll give up New California just to get rid of me. Well, I gotta tell you, I’m real flattered. That’s one hell of a price to put on a single guy’s head, you know. So in return, I’m gonna do you a favour. I’ll send all my people down to the planet, all the possessed here in Monterey and the other asteroids, everyone in the fleet, the whole goddamn lot of them. Then when we’re all down on the ground, we’ll take the planet away. This way nobody gets hurt, and you get back all the hostages I’m keeping up here. I’ll even throw in the antimatter as well. How does that grab you, Admiral?”

“It grabs me as fundamentally unbelievable.”

“Hey shit-for-brains, you want a bloodbath that bad and maybe I’ll just give the order to butcher all the hostages right now, before your weapons ever reach us.”

“No. Please don’t. I apologise. What I should have asked was, why? Why are you making this offer?”

Al leaned in closer to the sensor transmitting his image to the *Illustrious*. “Look, I’m just trying to do what’s right here. You’re going to kill people. Maybe I pushed you into that, maybe not. But now it’s here, I’m trying to stop it, I ain’t no goddamn maniac. So I offer you a way out that leaves both of us looking good.”

“Let me get this straight, you are proposing to ferry every possessed down to the planet, disarm your fleet and hand back the asteroids?”

“Hey, slow but smart. You got it. In return for letting us keep our bodies, we leave and don’t bother you again. That’s it. End of story.”

“Moving that many people down to the planet would take some time.”

“Emmet, my guy, he says about a week.”

“I see. So while my ships sit out here doing nothing, what guarantee can you make that you’re not simply trying to pull another Trafalgar strike against us under cover of this withdrawal?”

Al gave him the *look*. “That’s fucking low, pal. What’s to stop you shooting when we’re halfway through evacuating and I got fewer ships to give my people covering fire?”

“In other words, we have to trust each other.”

“Bet your ever-loving ass.”

“Very well. My ships will not launch any offensive while your evacuation is in progress. And Mr Capone?”

“Yeah?”

“Thank you.”

“No problem. You just be sure and tell everyone back home that I ain’t no cracker-barrel fishball. I got me some style.”

“Of course you have. I wouldn’t be here otherwise.”

Al leaned back in his chair and switched off the super telephone machine. “No, guess you wouldn’t,” he said contentedly.

Jezzibella stood in the bedroom doorway. She wore a blue towelling gown loosely over her green wrappings, helping to make her look slightly more human and not so much like a plastic version of the Tin Man out of Oz.

He shot to his feet. “Hey, you shouldn’t be out of bed.”

“It doesn’t make any difference if I’m lying down or not. The packages work either way.” She walked slowly across the lounge, barely flexing her knees. Lowering herself into the chair was difficult. Al made a real effort not to go over

and help, he could see how much doing it all by herself meant. Toughest girl in the galaxy.

“So what have you been doing?” she asked. The voice was muffled through the slit in her mask package.

“Putting a stop to all this crap. My guys, they can scoot down to the planet and get home free.”

“I thought so. That’s very statesmanlike of you, baby.”

“I got a reputation to keep, you know.”

“I know. But Al, what happens when the Confederation finds out how to bring planets back? I mean, that’s what all this was about, wasn’t it? Standing up to them on their home ground.”

He reached over the table and gripped her hands. The fingers were sticking out from the end of the packages, allowing him some genuine contact with her skin. “We lost, Jez. Okay? We were so goddamn good, we lost. Go figure. We frightened them too much. I had to make a choice. The fleet can’t fight this admiral off. No way. So letting the planet go is the smart way to deal with it. The way I see it, my guys get years more living in their bodies. At least. And the Confederation longhairs ain’t gonna risk bringing them back until they’ve found a way of giving us new bodies, or something. They’d just start the whole thing over. Who knows, maybe New California can vanish from the next universe, too. There’s a lot of things can happen. This way, nobody dies, we all win.”

“You’re the best, baby. I knew it right from the start. When do we go down?”

Al squeezed her fingers a little tighter, looking into her face. He could just see her new eyes through the green package, like she was wearing swimming goggles, only they were full of liquid. “You can’t, Jez. Christ, your medical stuff only just works up here. Where New California’s headed, who knows what’s going to go bust. You’re healing up real good now, all the docs say so. But you need more

time to get perfect. I ain't gonna allow nothing to interfere with that."

"No, Al, I'm going with you."

"Wrong. I'm staying here. See, we'll still be together."

"No."

"Yeah." He sat back, and waved an arm round in a gesture that took in the whole asteroid. "Done deal, Jez. Someone's got to stay here and keep the space weapons going while the guys fly down to the planet. I don't trust that motherhumping admiral none."

"Al, you can't operate the SD platforms. For fuck's sake, you don't even know how to work the hotel air conditioner."

"Yeah. But the admiral don't know that."

"They'll catch you. They'll expel you from that body. It'll be the beyond for the rest of time. Please, Al. I'll work the SD platforms. Be safe. I can live as long as I know you're safe."

"You're forgetting something, Jez: everyone forgets, except maybe good old brown-nose Bernhard. I'm Al Capone. I ain't scared of the beyond. Never was. Never will be."

The voidhawk from New California arrived just as First Admiral Aleksandrovich's flyer touched down. It meant he could walk into the Polity Council meeting primed with some good news—always a good negotiating position to be in.

His first surprise came at the Polity Council chamber door. Jeeta Anwar was waiting outside for the navy delegation.

"The President has asked me to inform you that no aides are required for this session," she said.

Samual Aleksandrovich gave Keaton and al-Sahhaf a bemused glance. "They're not that dangerous," he said jovially.

"I'm sorry, sir," Jeeta said.

Samual considered making a fuss; he didn't like that kind of surprise being thrown at him. If nothing else, it told him the coming meeting was going to be unusual, and probably disagreeable. Having his aides with him couldn't stop that. "Very well."

The second surprise was how few ambassadors were sitting around the big circle of antique sequoia in the council chamber. Three in total, representing New Washington, Oshanko, and Mazaliv. Lord Kelman Mountjoy was also present. Samual Aleksandrovich gave him a cautious nod as he sat to the left of Olton Haaker.

"I don't believe you have a quorum here," he said mildly.

"Not of the Polity Council, no," President Haaker said.

Samual didn't like the man's stilted voice; something was making the President very nervous. "Then please tell me what this meeting is."

"We are here to formulate future policy towards the possessed situation," Kelman Mountjoy said. "It's not something the old Confederation is capable of addressing satisfactorily."

"The old Confederation?"

"Yes. We are proposing a restructuring."

Samual Aleksandrovich listened in growing dismay as the Kulu foreign minister explained the reasoning behind the core-Confederation idea. Stopping the slow spread of possession, strengthening the defences of the key star systems. Establishing a solid, economically stable society capable of finding an overall solution.

"Do you propose including the Edenists?" Samual asked when he'd finished.

"They were not receptive to the concept," Kelman said. "However, since they have a reserve position along very similar lines, their ultimate inclusion is highly probable. We would have no problem continuing to trade with them, as they

are by and large immune to the kind of infiltration that results from quarantine-busting flights.”

“And they supply every Adamist world with energy,” Samual said scathingly.

Kelman managed not to smile. “Not all,” he said softly.

Samual turned to the President. “You cannot allow this to happen, it is economic apartheid. It transgresses every ethic of equality which the Confederation represents. We must protect everybody alike.”

“The Navy isn’t even capable of doing that now,” Olton Haaker said sadly. “And you’ve seen the economic projections my office compiled. We cannot afford the current level of deployment, let alone sustain it for any reasonable length of time. Something has to give, Samual.”

“In effect, it’s already given,” Kelman said. “The attack on Arnstat and New California was an admission that we can no longer afford to indulge the current status quo. The Polity Council chose, and you agreed, that we had to lose those planets in order to help safeguard the rest. The core-Confederation is the logical conclusion of that development. It safeguards our entire race by ensuring that there will always be a part of it free from possession and able to search for a solution.”

“I find it interesting that your proposal safeguards only your part of the human race. The rich section.”

“Firstly, by ending the unrealistic level of subsidy our worlds extend to stage-two star systems, they will also contract and therefore become safer. Secondly, there is no point in the richer star systems impoverishing and weakening themselves when to do so will not result in a solution. We have to address the real facts, and do so with resolution.”

“The quarantine works. In time, and if everyone pools their intelligence data, we can end the illegal flights. There is no more Organization; Capone has surrendered New California to Admiral Kolhammer.”

“These arguments are the ebb and flow in the tide of obsolete politics,” Kelman said. “Yes, you’ve nullified Capone. But we’ve now lost Earth. Mortonridge has been effectively liberated, but at a shocking price. Zero-tau can de-possess someone, but the released body will be plagued with cancer and tie up our medical facilities for years. This has all got to stop. A line must be drawn under the past in order to free our future.”

“You approach this as if possession is the whole problem,” Samuel said. “It is not, it is a spinoff from the fact we have immortal souls and some of them are entrapped in the beyond. The answer to this—how we learn to live with such knowledge, whatever it is—must be embraced by the entire human race; from some delinquent mugger on a stage-one colony planet right up to your king. We have to face this as one. If you split us up, you cannot reach and educate the very people who are most likely to be blighted by this revelation. I cannot agree to this. I will not agree to this.”

“Samual, you have to,” the President said. “Without funding from the core-Confederation worlds, there can be no Navy.”

“Every planetary system funds the Confederation Navy.”

“Not equally, they don’t,” said Verano, the New Washington ambassador. “Between us, the worlds proposing to form the core-Confederation provide eighty per cent of your over-all funding.”

“You can’t just split . . . Ah! Now I understand.” Samuel gave Olton Haaker a contemptuous look. “Did they offer you the new presidency in exchange for pushing the transition? You might call this coalition the core-Confederation, but in effect you’d all be withdrawing from the actual Confederation. There is no continuation, certainly not in legal terms. Every one of my officers renounced their national citizenship upon joining; the Confederation Navy is responsi-

ble to the Assembly in its entirety, not special interest blocs.”

“A hell of a lot of your fleets are made up from national detachments,” Verano said hotly. “They will be taken back along with fleet bases. You’d be left with ships you couldn’t support in star systems you couldn’t defend.”

Kelman held up a hand, raising his index finger, which silenced the ambassador. “The Navy will do as you say, Samual, we all acknowledge that. As for legality and ownership, ambassador Verano has a point. We have paid for those ships.”

“And the core-Confederation would become the new law,” Samual said.

“Precisely. You want to protect humanity, then become a realist. The core-Confederation will be brought into existence. You understand politics probably better than most of us; you would never have been appointed First Admiral otherwise. We have decided this is the best way our interests are served. We are doing it so that ultimately a solution will be achieved. It’s in our own petty selfish interest to make sure a solution is found, God knows I have no wish to die now I know what awaits. If nothing else, you can trust us to put unlimited resources into the problem. Help us safeguard our boundaries, Admiral, bring the fleet over to the core-Confederation. We are the guarantee of ultimate success for our whole race. That is what you were sworn to protect, I believe.”

“I do not need reminding of my honour by you,” Samual said.

“I apologise.”

“I will need to think about this before I give you an answer.” He rose to his feet. “I will also consult my senior officers.”

Kelman bowed. “I know this is difficult. I’m sorry you were ever put in such a position.”

Samual didn't speak to his two aides until he was back on the Marine flyer and heading up to the orbiting station that was serving as his new headquarters.

"Can the remaining star systems afford to keep the Navy going by themselves?" al-Sahhaf asked.

"I doubt it," Samual said. "God damn it, they'll be left absolutely defenceless."

"A neat piece of applied logic," Keaton said. "They are going to be left defenceless anyway. If you don't bring the Navy to the core-Confederation, then you will have achieved nothing for them, and weakened the core-Confederation at the same time."

"Are you saying we should go along with this?"

"Personally sir, no I don't. But it's the oldest political squeeze manoeuvre there is. If we're left out in the cold we can achieve nothing. If we join up, then there's the opportunity to influence policy from inside, and from a considerable position of strength."

"Lord Mountjoy isn't stupid," al-Sahhaf said. "He'll be willing to negotiate with you in private. Perhaps we can maintain the CNIS throughout the class-two star systems, continue to provide the governments intelligence on possessed movements."

"Yes," Samual said. "Mountjoy would favour that, or something very similar. It's the ebb and flow of politics."

"Do you want to meet him, sir?" Keaton asked.

"That almost sounds as though you're putting temptation in my way, Captain."

"No, sir!"

"Well, I don't want to meet him. Not yet. I am not prepared to see the Navy disbanded and junked through my stubbornness. It's a powerful force to counter the possessed at a physical level, and that must not be lost to the human race. I need to talk this through with Lalwani, and see if the Edenists would consider supporting the fleet. If they can't,

then I'll meet Mountjoy and discuss handing it over to the core-Confederation. We must remember that military force ultimately exists to serve the civilian populace, even though we might despise their choice of leaders."

The intensity of the cold was astonishing. Waves of it slithered right through every part of the escape pod, washing the heat away. The temperature sink was so profound it began to alter the colour of plastic components, bleaching them like a dose of ultra violet light. Tolton's breath condensed into a layer of iron-hard frost on every surface.

They'd taken the survival clothing from the supply lockers, and he'd put on as many layers as it was physically possible to do. He looked even fatter than Dariat, his face shrouded by thick bandages of cloth he'd wound round and round to protect his ears and neck. His exposed skin had acquired its own sprinkling of frost, each eyelash resembling a miniature icicle.

The pod's power cells were draining away as fast as the heat. At first the environmental circuit had chugged away merrily, heating the air and extracting the water vapour. Then they ran a simple analysis and realized that at their current rate of use the cells would be empty in forty minutes. Dariat slowly shut down all the pod's systems, like navigation and communications, and thrusters. Then when Tolton was snug in two heated suits and all his insulated clothes, he switched off everything except the carbon dioxide scrubber and a single fan. At that consumption rate, the power cells should have lasted two days.

Tolton's heated suits went through their inventory of power cells a lot quicker than they'd expected. The last one was exhausted fifteen hours after they'd entered the mélange. After that he started drinking soup out of self-heating sachets.

"How much longer is the hull going to hold out?" he

asked between juddering sips. He was wearing so much clothing he couldn't bend his arms, so Dariat had to hold the sachet nipple to his lips.

"Not sure. My extra senses aren't up to that kind of work." Dariat beat his own arms against his chest. The cold didn't affect him as badly, but even so he'd clad himself in several woolly sweaters and some thick track suit bottoms. "The nulltherm foam has probably gone by now. The hull will just evaporate away until it's so thin the pressure from the mélange implodes us. It'll be quick."

"Pity. I could do with feeling something. Bit of pain would be a nice sensation right now."

Dariat grinned over at his friend. Tolton's lips were jet black, the skin peeling away.

"What's wrong?" Tolton croaked.

"Nothing. Just thinking, we could try firing one of the rockets. Maybe that would heat the pod up a bit."

"Yeah. It would push us out to the other side quicker, too."

"'Bout time that happened. So, if you could have anything you wanted waiting for us, what would it be?"

"Tropical island, with beaches stretching on for kilometres. Sea as warm as bathwater."

"Any women there?"

"Oh God yes." He blinked, and his lashes stuck together. "I can't see anything."

"Lucky you. Do you know what a sight you are?"

"What about you? What do you want waiting on the other side?"

"You know that: Anastasia. I lived for her. I died for her. I sacrificed my soul for her . . . well, her sister anyway. I thought she might be watching at the time. Wanted to make a good impression."

"Don't worry, you already have, man. I keep telling you,

a love like yours is going to make her giddy. The chicks really dig that kind of mad devotion crap.”

“You’re the most insensitive poet I’ve ever met.”

“Street poet. I don’t do the roses and chocolates routine, I’m too much of a realist.”

“I bet roses and chocolates pay more.” When there was no answer, Dariat took a close look at Tolton’s face. He was still breathing, but very slowly, air whistling past the fangs of ice crusting his mouth. There were no shivers any more.

Dariat rolled back onto his own acceleration couch and waited patiently. It took another twenty minutes before Tolton’s ghost rose up out of the bloated bundle of fabric. He took one astounded look at Dariat, then put his head back and laughed.

“Oh shit, will you grab a load of this. I’m the soul of a poet.” The laughter degenerated into sobbing. “The soul of a poet. Get it? You’re not laughing. You’re not laughing and it’s fucking funny. It’s the last funny thing you’ll ever know for the rest of all eternity. *Why aren’t you laughing?*”

“Shush.” Dariat’s head came up. “Do you hear that?”

“Hear them? There’s a billion trillion souls out there. Of course I can fucking hear them.”

“No. Not the souls in the *mélange*. I thought I heard someone calling. A human voice.”

28

It had been a long night for Fletcher Christian. They'd kept him chained to the altar with electricity coursing through him while the madness whirled all around. He'd seen Dexter's followers chopping up the beautifully crafted wooden model of St Paul's which Sir Christopher Wren had built to show off his dream, throwing splintered fragments into the iron braziers which now illuminated the building. The silent slaughter as people were dragged up to the altar where Dexter waited with the anti-memory weapon. Fletcher wept as their souls were destroyed in readiness for their bodies to be replenished by those from the beyond, personalities more compliant to the dark Messiah's wishes. Salty tears leaked into the runes mutilating his cheeks, stinging like acid. Courtney's crazed shrieking laugh as Dexter ravaged her until blood flowed and skin blistered.

Sacrilege. Murder. Barbarism. It never stopped. Each act pounding away at the few senses he had remaining. He recited the Lord's Prayer over and over until Dexter heard him, and the possessed closed in, screaming some obscene chant in counter. Their cruel words slipped into him with the force of daggers, their joy in evil tormenting him into si-

lence. He feared his mind would snap from the pressure of such depravity.

Throughout it all, the font of energistic power increased along with their numbers, spreading out to engulf mind and matter alike. This was not the shared longing he'd known on Norfolk, the genuine appetite to hide from emptiness. Here Dexter absorbed what strength his followers offered and forged its shape with his own damned desires.

As the sullied red light crept through the open door, mocking the night, Fletcher finally heard the cries of the fallen angels. On top of everything else, their diabolical poignancy nearly broke his resolve. Surely not even Dexter could think of letting such beasts loose upon the earth.

"No," Fletcher wailed. "You cannot bring them forth. It is madness. Madness. They will consume us all."

Dexter's face slid into view above him, coldly radiant with satisfaction. "About fucking time you understood."

Lady Macbeth emerged from her jump deep in interstellar space, one thousand nine hundred light years from the Confederation. The sensation of isolation and loneliness among those on board was nothing to how small that distance made them feel.

Star tracker sensors slid out of their recesses, gathering up the faint harvest of photons. Navigation programs correlated what was there, defining their position.

Joshua triangulated on their target, an unremarkable point of light only thirty-two light-years away now. Their next jump coordinate sprang into his mind, blinking purple at the end of a long neuroiconic tube of orange circles. The star was slightly to one side of it, a distance that represented relative delta-V. Starship and star were still moving at very different velocities as they orbited the galactic core.

"Stand by," he said. "Accelerating."

There were groans across the bridge. They dried up soon

enough as he activated the antimatter drive. Four gees pushed everyone down into their couches except for Kempster Getchell; the old astronomer had gone into a zero-tau pod after the second jump. "Too much for my bones," he'd complained gamely. "Fetch me out when we get there."

Everyone else stuck it out. Not that the crew had a choice. Seventeen jumps in twenty-three hours, each one fifteen light-years long. In itself, probably a record. Nobody was counting now; they'd devoted themselves entirely to keeping the systems functioning smoothly, a professionalism not many could match. Pride had increased to accompany an edgy anticipation as the Sleeping God star grew closer.

Joshua remained in his acceleration couch, piloting them to each coordinate with his usual sublime competence. Nothing much was said as the Orion Nebula shrank away behind them. It was smaller in every star tracker scan, dwindling down to a diminutive fuzzy patch of light the last familiar astronomical feature left in the universe. Every fusion generator was running at maximum capacity, recharging the nodes fast. That was why Joshua used high gees between coordinates, instead of the usual one tenth. Time. It had become the most precious commodity left to him.

Instinct drove him on. That enigmatic, bland star holding steady at the apex of the sensor lock was giving out the same siren song as those strikes in the Ruin Ring once had. So much had happened on this flight. So much of his own hope had been invested now. He couldn't, didn't, believe that it had all been for nothing. The Sleeping God existed. A xenoc artefact, powerful enough to interest the Kiint. They'd been right all along, the discoveries made throughout the flight continually emphasising its importance.

"Nodes charged and ready, Captain," Dahybi reported.

"Thanks," Joshua said. He automatically ran a vector check. The old girl was performing well. Three more hours, two more jumps, and they'd be there. The flight would be

over. That was the part he found hard to credit. There were so many roots elevating the *Lady Mac* to this encounter. Kelly Tirell and the mercs back on Lalonde. Jay Hilton and Haile (wherever they were now). Tranquillity escaping the Organization fleet. Further back than that, a single message being passed across 1,500 light-years of empty space, loyally relayed from star to star by a species that never should have escaped their sun's expansion in the first place. And Swantic-LI, finding the Sleeping God originally. Improbable chances in an event chain 15,000 years long linking that single unlikely meeting to the fate of an entire species.

He didn't believe in odds that long. That just left destiny, divine intervention.

Interesting, given what they were supposedly flying towards.

Louise awoke in some confusion. A young man was lying on top of her. Both of them were naked.

Andy, she remembered. It was his flat: small, grubby, cluttered, and so warm the air itself seemed to have thickened. Condensation had licked every surface to glisten in the dark-pink light of dawn that drizzled through the fogged window.

I will not regret what we did last night, she told herself firmly. I have no reason to feel guilty. I did what I wanted to. I am entitled to do that.

She tried to ease him to one side and slip out from underneath, but the bed simply wasn't big enough. He stirred, frowning as he focused on her. Then he flinched in shock.

"Louise!"

She gave him a brave smile. "At least you remembered my name."

"Louise. Oh God." He lurched back into a kneeling position. His eyes stared down greedily at her body, and his mouth twisted into a beatific smile. "Louise. You're real."

“Yes. I’m real.”

His head darted forward, and he kissed her. “I love you, Louise. Darling, my darling, I love you so much.” He lowered himself against her, kissing her face urgently; his hands cupped her breasts, fingers teasing her nipples exactly the way she’d cherished last night. “I love you, and we’re together at the end.”

“Andy.” She shifted round, wincing at how sore her breasts were. For someone so skinny, he was surprisingly strong.

“Oh God, you’re so beautiful.” His tongue was licking over her lips, desperate to be inside her mouth.

“Andy, stop.”

“I love you, Louise.”

“No!” She pushed herself up. “Listen to me. You don’t love me, Andy, and I don’t love you. It was just sex.” Her mouth parted in a small smile, softening the blow as much as she could. “All right, it was *very* good sex. But nothing else.”

“You came to me.” His pleading voice came close to cracking, there was so much hurt in the words.

Louise’s guilt was awful. “I told you that everyone else I know has either left the arcology or been captured by the possessed. That’s why I’m here. As for the rest . . . well, we both wanted that. There’s no reason not to now.”

“Don’t I mean anything to you?” he asked in desperation.

“Of course you do, Andy.” She stroked his arm, and leaned in closer, making the contact more intimate. “You don’t think I’d do that with just anyone, do you?”

“No.”

“Remember what we did?” she whispered in his ear. “How bad we were?”

Andy blushed, unable to look at her. “Yes.”

“Good.” She kissed him lightly. “This is one night we’ll keep with us forever. Nobody can ever take it away from us, no matter what happens to us now.”

"I still love you. I have ever since I saw you. That'll never change."

"Oh Andy." She cradled him against her chest, rocking gently. "I didn't want to hurt you. Believe me, please."

"You haven't hurt me. You couldn't. Not you."

Louise sighed. "Funny how different life could be, so many things that make you take one route instead of another. If only we could live them all."

"I'd live them all with you."

She hugged him tighter. "I think I'm going to envy the girl who winds up with you. She's going to be so lucky."

"Won't happen now, will it?"

"No. I suppose not." She gave the opaque window a resentful look, hating the day outside, the way time was advancing and what it would invariably bring. There was something else coming through the glass, riding the crimson light: a sense of rancour. It made her uneasy, almost fearful. And that red light was very deep for a dawn sun, it reminded her of Duchess.

She let go of Andy and padded over to the high window. Standing on one of the boxes brought her face up level with it. She smeared the condensation away.

"Oh dear Jesus."

"What's the matter?" Andy asked. He hurried across and peered over her shoulder.

It wasn't dawn shining in, that was still two hours away. A large circular swirl of red cloud hung in the centre of the Westminster dome, a few hundred yards above the ground. Its malign glow glimmered off the geodesic crystal above, turning the struts to a lattice of burnished copper. The underside shone a blood-red light down on the roofs and walls of the city, staining them all an unhealthy magenta. Its leading edge was less than a mile away from the tenement, undulating gently.

"Shit!" he hissed. "We've got to get out of here."

“There’s nowhere to go, Andy. The possessed are all around us.”

“But . . . Oh shit. Why isn’t somebody doing something? New York is still holding them off. We should organize ourselves and fight back like them.”

Louise walked back to the bed and sat down carefully. After last night, some movements were quite difficult. She used her neural nanonics to run a physiological review, making sure the baby was all right. It was, and she had nothing worse than a few tender areas. The medical nanonic package infused some biochemicals into her bloodstream which should help. “We did try to do something,” she said. “But it failed last night.”

“You did?” Andy was standing in front of her, sweat pricking his skin. He rubbed his forehead, brushing damp hair from his eyes. “You mean you’re involved in this?”

“I came to Earth to warn the authorities about a possessed called Quinn Dexter. I needn’t have bothered, they already knew. He’s the one behind all this. I was helping them to find him, because I’ve seen him before.”

“I thought the Capone Organization had infiltrated us.”

“No, that’s just what Govcentral told the media. They didn’t want anyone to know what they were actually up against.”

“Bloody hell,” he groaned, badly downcast. “Fine excuse for a net don I make. Can’t even find that out for myself.”

“Don’t worry about it. GSDI is a lot smarter than people think.” She stood up, the reminder of B7 making her restless. “I need the bathroom. You said it was at the end of the hall?”

“Yes. Er, Louise.”

“What?”

“I think you’ll need something to wear.”

She looked down at herself, and grinned. Totally unself-conscious standing naked in front of a boy, and not just any

boy, a casual sex partner. Maybe I have lost some of my Norfolk past after all. "I think you're right."

Her own clothes were in the pile where she'd thrown them, still damp and badly crumpled. Andy leant her a pair of grey jeans and a smartish navy-blue Jude's Eworld sweat-shirt, pulling them out of a box where they'd been partially protected against the humidity.

When she got back he'd just finished wiring a couple of power cells into his air conditioner. The galvanised box started shuddering as the motor spun up, then sent out a clammy stream of cold air. Louise stood in front of it trying to get her hair dry.

"I've got some food stockpiled," Andy said. "Do you want breakfast?"

"Please."

He pulled some preprepped meal trays out of a box and slid them into the oven. Louise started examining the flat in detail. He really was an electronics fanatic, just as he'd claimed at the Lake Isle restaurant. None of his wages had been spent on furnishings, or even clothes by the look of it. Gadgetry lay everywhere: ageing tools and blocks, spools of wire and fibre, microscopic components in lens cases, delicate test rigs; one wall was a rack of fleks. When she peeked into the other room, it was jumbled high with ancient domestic units. He scavenged them for components, he said. Repair work brought in some handy cash. She smiled at the familiar dinner jacket which was hanging up on the back of the door in its own plastic sheath, so obviously out of place.

The oven ejected their meal trays. Andy pushed a flat orange juice carton into the nozzle on his water dispenser; bubbles gurgled up through the big glass bottle. The carton expanded outwards as the juice constituted itself.

"Andy?" Louise stared at the conurbation of electronics,

suddenly cursing herself. "Have you got a working communications block here, something that can reach a satellite?"

"Of course. Why?"

"Louise, my God, I thought we'd lost you," Charlie datavised. "The sensor satellite says you're at a tenement on Halton Road. Ah, I see, that's Andy Behoo's address. Are you all right?"

"I survived," she datavised back. "Where are you?"

"I'm up in the Halo. It was a bit of a mad dash, but I thought it expedient after last night's debacle. Do you know if Fletcher got out?"

"I've no idea. I didn't see anyone else once I started running. What about Ivanov?"

"Sorry, Louise. He didn't make it."

"There's just me, then."

"Looks like I underestimated you again, Louise. My one consistent error."

"Charlie, there's a red cloud under the dome."

"Yes, I know. Clever move on Dexter's part. It means the SD electron beams can't strike it unless they blow the dome as well. It also means I've got virtually no sensor coverage underneath now. I tried sending my affinity-bonded birds and rats through to see if they could pinpoint him for me, but I lose contact with them every time. And we all thought their energistic power didn't affect bitek."

"Fletcher says they're aware of everything that happens under their cloud. Dexter probably kills the animals."

"Very likely. That doesn't leave us with much, does it?"

"This red cloud is different," she datavised. "I thought you should know that. It's why I called, really."

"What do you mean?"

"I was under one in Norfolk as it was gathering together, that was nothing like this. I can feel this one, it's like a really

low vibration, one that you can't quite hear. It's not just here to shut away the sky, it's really evil, Charlie."

"That'll be Dexter. He must have gathered quite a few possessed together now. Whatever he intends to do, it started with that cloud."

"I'm frightened, Charlie. He's going to win, isn't he?"

"Can you and Andy get to one of the outer domes? I have operational agents in place there. I can get you out."

"The cloud's growing, Charlie. I don't think we'll make it."

"Louise, I want you to try. Please."

"Guilty, Charlie, you?"

"Perhaps. I did get Genevieve to Tranquillity. The black-hawk captain swears he'll never accept another charter from my company."

Louise grinned. "That's my sister."

"Will you leave the tenement now?"

"I don't think so. Andy and I are happy where we are. And who knows what'll happen when Earth is taken out of the universe? It might not be so bad."

"It won't happen, Louise. That's not what Dexter's about. He wants to obliterate the universe, not leave it. And there are people on Earth who can stop him from doing anything at all."

"What do you mean? You've never been able to stop him."

"The red cloud's appearance has finally given our wondrous President some backbone. He's worried it means the possessed are ready to take Earth out of the universe. The senate have now given him approval to use SD weapons against the arcologies, and eliminate the possessed. It's the new fatalism, Louise. The Confederation abandoned Arnstat and New California so they could be rid of Capone. The President will sacrifice a minority of the republic's citizens to save the majority. Not that history will remember him kindly for it, though I expect the survivors in the other arcologies will be quietly grateful."

“You have to stop it, Charlie. There are more people in London than there are on the whole of Norfolk. You can stop it, can’t you? B7 can’t let them all die. You rule Earth. That’s what you said.”

“We can stall the order for a few hours, at most. Crash the command communication circuits, have SD officers refuse to carry out their orders. But ultimately, a direct order from the President will get through and be obeyed. The platforms will fire gamma-ray lasers into the arcologies. Every living cell inside the domes will be exterminated.”

“No. You have to stop them.”

“Louise, get yourself to one of the outer domes. You’ve got the anti-memory. You can use it against anyone who tries to stop you.”

“No!” she yelled out loud. Her hand smashed down on the table, making the meal trays and glasses bounce. “No. No. No.” She picked up the communications block and hurled it against the wall. Its casing cracked, sending plastic splinters skittling along the floor. “I won’t.”

Andy had frozen in his chair, staring at her in consternation. She whirled round to face him. “They’re going to kill everybody. The President’s going to fire SD weapons into the dome.”

He got up and put his arms round her, trying to calm her angry shaking. Even in bare feet she was half a head taller, he had to look up to see the dismay in her eyes.

“We have to stop him,” she said.

“The President?”

“No, Dexter.”

“The possessed one? The maniac?”

“Yes.”

“How?”

“I don’t know. Tell him. Warn him! Get him to dispose of the red cloud. He’ll understand that if he has no followers left alive then he’s nothing.”

“Then what?”

“I don’t know!” she shouted. “But it will stop everyone from being killed, isn’t that worth something to you?”

“Yes,” he stammered.

She went over to her pile of clothes and dug out the anti-memory weapon. “Where are my shoes?”

Andy took one look at the neat black tube she was holding with such determination, and realized just how serious she was. His first thought was to lock the door, prevent her from leaving. He was too scared even to do that. “Don’t go out there.”

“I have to,” she snapped back. “None of those monsters care about people.”

Andy dropped to his knees. “Louise, I’m begging you. They’ll catch you. You’ll be tortured.”

“Not for long. After all, we’re all going to be slaughtered.” She pushed her foot into one shoe and fastened the side clips.

“Louise. Please!”

“Are you going to come with me?”

“That’s London out there,” he said, waving an arm at the window. “You’ve got a couple of hours to find one person. It’s impossible. Stay here. We’ll never know when it happens. Not an SD weapon, they’re so powerful.”

She glared down at him. “Andy, haven’t you followed any news? You have a soul. You’ll know exactly when it happens. There’s a good chance you’ll be stuck into the beyond.”

“I can’t go out there,” he moaned. “Not where *they* are. Don’t go.”

She pulled her other shoe on. “Well, I can’t stay here.”

Andy looked up at her as she stood over him, tall, beautiful, and resolute. Utterly glorious. He’d spent all night making love to her, punishing his body with a dangerous level of stimulant programs so she would be completely overwhelmed. And it meant nothing to her. She would never be

his, for she'd seen the real him. They were further apart now than they had been before he knew she lived.

His hand wiped over his nose, an attempt to cover up his sniffing. "I love you, Louise." He heard the pitiful words come out of his mouth, and despised himself for everything he was, everything he could never become.

Exasperation mingled with embarrassment. Louise didn't know if she wanted to shove him aside or kiss him. "I still enjoyed last night, Andy. I wouldn't want it any different." A pat on his bowed, trembling head would be too awful. She moved round him, and went out of the door, closing it quietly behind her.

Loud voices and banging doors woke Jay. She sat up in bed and yawned extravagantly, stretching her arms wide. It was night outside, she could just hear the gentle windrush sound of waves rolling onto the beach above the noises in the chalet. People were moving through the rooms, talking in excited tones. Footsteps trundled up the creaky wooden steps to the veranda, and the front door banged again.

She found Prince Dell and tiptoed into the short hallway. There'd never been such a commotion in the chalet before, not even when the old-timers were planning the new colony. Whatever was going on must be terribly important, which could make eavesdropping interesting.

The voices stopped.

"Come in, Jay," Tracy called from the lounge.

Jay did as she was told. It was impossible to get away with anything when Tracy was around. Seven of the ancient adults had joined Tracy, sitting and standing round the lounge. Jay kept her head down as she hurried over to the big armchair Tracy was sitting in, too shy to say anything.

"Sorry, poppet," Tracy said as Jay slithered up onto the cushions beside her. "Did this noisy rabble wake you?"

"What's the matter?" Jay asked. "Why's everyone here?"

“We’re trying to decide if we should petition Corpus for intervention,” Tracy said. “Again!”

“Something’s happening on Earth,” Arnie said. “We didn’t realize it at first, but Quinn Dexter might be about to do something extremely dangerous.”

“Corpus won’t intervene,” Galic said dejectedly. “There’s still no reason. You know the rules: only if another, unaware species is endangered. Quinn Dexter, according to the textbooks, qualifies as human. Therefore this will be self-inflicted.”

“Then the textbook should be rewritten,” Arnie grumbled. “I wouldn’t classify him as anything close to human.”

“Corpus won’t intervene because the President will use SD weapons, that barbarian.”

“Not in time to stop Dexter, he won’t,” Tracy said. “Especially if B7 intervenes and delays the fire command.”

Jay snuggled up closer to Tracy. “What’s Dexter going to do?”

“We’re not absolutely sure. It might be nothing.”

“Ha,” Arnie grunted. “Just you wait and see.”

“Are you watching it?” Jay asked, suddenly not at all sleepy.

Tracy glared at Arnie. There was a mental exchange, too. Jay could feel it even if she couldn’t make out individual words. She’d been getting good at that lately.

“Please!” Jay begged. “It’s my world.”

“All right,” Tracy said. “You can stay up and watch for a little while. But don’t think you’re getting to see any gory bits.”

Jay beamed at her.

The adults settled down on the other chairs, packing three onto the settee. Tracy’s television was switched on, showing a deserted street of ancient buildings. A tight tapestry of red clouds were glowing overhead. Jay shuddered at the sight. They were just like the ones on Lalonde.

“That’s London,” Tracy said. She handed Jay a mug of hot chocolate.

Jay propped Prince Dell up against her tummy so he’d have a good view, and took a contented sip of the creamy drink. Someone was walking down the middle of the street.

Lady Mac emerged a hundred million kilometres out from the F-class star, five degrees above the ecliptic. As it was an uncharted system, Joshua ordered the combat sensors to deploy and conduct a fast preliminary sweep. Their response time was quicker than the more comprehensive standard array, if there was anything out there on a collision course, they’d hopefully discover it soon enough to jump away.

“Clean space,” Beaulieu reported.

For the first time in thirty hours, Joshua managed to relax, sagging back into the cushioning. He hadn’t realized how tight his neck and shoulder muscles had become, they were lines of hot stone under his skin.

“We did it!” Liol whooped.

Amid the noisy round of self-congratulation, Joshua ordered the flight computer to extend the standard sensor booms. They slid out of the fuselage along with the thermo-dump panels. “Alkad,” he datavised. “Get Kempster out of zero-tau, please. Tell him we’ve arrived.”

“Yes, Captain,” she replied.

“Beaulieu, Ashly, activate the survey sensors, please. The rest of you, let’s get *Lady Mac* into standard orbital configuration. Dahybi, I still want to be able to jump, we’ll keep the nodes charged.”

“Aye, Captain.”

“Fuel status?” Joshua asked.

“Sufficient,” Sarha told him. “We have forty per cent of our fusion fuel left, and fifty-five per cent of the antimatter remaining. Given we burned fifteen per cent of the antimatter to move Lalarin-MG, we’ve got enough to get us back to

the Confederation. We can even jump around this system, providing you don't want to explore every moonlet."

"Let's hope we don't have to," he said. The Swantic-LI message hadn't mentioned where in the system the Sleeping God was; in orbit around a planet or orbiting the star by itself.

The crew loosened up as *Lady Mac* changed from flight mode to her less demanding orbital status. They drifted around the bridge, used the washroom. Ashly went down to the galley and fetched a meal. Prolonged exposure to high gees was severely tiring. And eating anything substantial during the acceleration was unwise. The mass put a lot of pressure on internal organs, even with artificially strengthened membranes. They devoured the spongy pasta cakes eagerly, chasing runaway squirts of hot cheese sauce round the bridge.

"So if it sees the whole universe," Liol said, talking round a mouthful, "Do you reckon it knows we're here?"

"Every telescope sees the whole universe," Ashly said. "That doesn't necessarily mean they can all see us."

"Okay, it detected our gravitonic distortion when we jumped in," Liol said, unperturbed.

"Where's your evidence?"

"If it knows about us, it's keeping quiet," Beaulieu said. "Sensors haven't found any electromagnetic emissions out there."

"How did the Tyrathca find it then?"

"Easily, I would think," Dahybi said.

Under the direction of Kempster and Renato, Beaulieu launched their survey satellites. Sixteen of them were fired, racing away from *Lady Mac* at seven gees. They were arranged in a globular formation, keeping the starship at their centre. After two minutes their solid rockets jettisoned, leaving them flying free. The main section was an omniphase visual-spectrum sensor array, a giant technological

fly's eye, looking every way at once. Between them, they formed an ever-increasing telescope baseline, capable of huge resolution. Its only real limit was imposed by the amount of processing power available to correlate and analyse the incoming photonic data.

The sweep was conducted by registering every speck of light with a negative magnitude (in standard stellar classification the brightest visible star is labelled magnitude one, while the dimmest is a six—anything brighter than a one has to be a planet and is assigned a negative value). Their positions were then reviewed five times a second to see if they were moving.

Once the planets had been located, the telescope could be focused on them individually to see if the extensive spatial disturbance Swantic-LI had referred to was in orbit around them. They were assuming it was a visible phenomena; the Tyrathca didn't have gravitonic detector technology. If nothing was found, a more comprehensive sweep of the system would have to be conducted.

"This is most unusual," Kempster datavised after the first sweep was completed. He and Renato were using the main lounge in capsule C, along with Alkad and Peter. Their specialist electronics had been installed, transforming it into a temporary astrophysics lab.

Joshua and Liol swapped a look shading between surprise and amusement. "In what way?" Joshua asked.

"We can only detect a single negative-magnitude source orbiting this star," the astronomer said. "There's simply nothing else out there. No planets, no asteroids. *Lady Macbeth's* sensors can't even find the usual clouds of interplanetary dust. All matter has been cleared away, virtually down to a molecular level. The only normal occurrence is solar wind."

"Cleared away, or just sucked into the spatial disturbance," Sarha muttered.

"So what is the source?" Joshua datavised.

“A moon-sized object, orbiting three hundred million kilometres from the star.”

Joshua and the rest of the crew accessed the sensor array. It showed them a very bright point of light. Completely non-descript.

“We can’t get any sort of spectral reading,” Kempster said. “It’s reflecting the sun’s light at essentially a hundred per cent efficiency. It must be clad in some kind of mirror.”

“You did say: easy,” Ashly told Dahybi.

“That’s not easy,” Joshua said. “That’s obvious.” He loaded the object’s position into the flight computer and plotted a vector to a jump coordinate which would bring them out one million kilometres away from the enigmatic object. “Stand by. Accelerating in one minute.”

The impulsive anger which had pushed Louise out of Andy’s flat had faded by the time she reached Islington High Street. Walking down the empty streets had given her far too much time to think, mainly about how headstrong and stupid this idea was. At the same time that original reason held fast. Somebody had to do something, however futile. It was the getting captured and facing Dexter part that was making her legs all wobbly and recalcitrant.

Her neural nanonics crashed when she started off along St John Street. Not that she really needed her map file any more. He wouldn’t be far from the centre of the red cloud; all she had to do was walk straight down to the Thames, only a couple of miles. She knew she’d never actually get that far.

The edge of the cloud, a frayed agitated boundary, was still creeping slowly out towards the skyscrapers behind her. It had already reached Finsbury, barely a quarter of a mile ahead of her now. A gruff sonorous thunder reverberated down from its quaking underside, echoing along the deserted streets. Leaves on the tall evergreen trees trembled in disharmony as erratic gusts of warm air blew out from the

centre. Birds rode the thermals high overhead. She could see the tiny black flecks streaming together into huge flocks, all of them heading in the same direction: out.

They were smarter than people. She was amazed that she hadn't encountered anyone fleeing the cloud's advance. The inhabitants were all staying barricaded behind their doors. Was everyone paralysed by fear like Andy?

She passed under the cloud, the sleet of redness closing in on her like a perverted nightfall. It wasn't just the humid air blowing against her now: the feeling of dismay strengthened, slowing her pace. The rumbles of thunder above her thickened, never quite dying away. Forked slivers of blackness crackled between the roiling tufts: black lightning, draining photons out of the sky.

When they'd said goodbye, Genevieve had offered her Carmitha's silver pendant of earth. Louise had refused. Now she wished she hadn't. Any totem against the evil would be welcome. She decided to think about Joshua, her real talisman against the harsh truth of life beyond Norfolk. But that just made her slip into the memory of Andy. She still didn't regret that—quite. As if it mattered.

Louise had made it down Rosebery Avenue and turned into Farringdon Road when the possessed walked out into the street in front of her. There were six of them, moving with unhurried indolence, dressed in austere black suits. They lined up between the pavements and stood facing her. She walked up to the one in the middle, a tall thin man with a flop of oily brown hair.

"Girl, what the fuck are you about?" he asked.

Louise pointed the anti-memory weapon straight at him, its end barely a foot from his face. He stiffened, which meant he knew what it was. It wasn't much of a comfort to her; somebody else had one. She knew who.

"Take me to Quinn Dexter," she told him.

They all started laughing. “*To him?*” the one she was threatening said. “Girl, are you twisted, or what?”

“I’ll shoot if you don’t.” Her voice was very close to cracking. They would know that, and the reason why, them and their devilish senses. She gripped the weapon tighter to stop it shaking about.

“My pleasure,” he said.

She jabbed the weapon forward. His head recoiled in synchronization.

“Don’t push it, bitch.”

The possessed started walking down the road. Louise took a couple of hesitant paces.

“Follow us,” the tall one told her. “The Messiah is waiting for you.”

She kept the weapon up, not that it would do much good, they all had their backs to her now. “How far is it?”

“Close to the river.” He glanced back over his shoulder, lips stretched into a thin smile. “Do you have any idea what you’re doing?”

“I know Dexter.”

“No you don’t. You wouldn’t be doing this if you did.”

The pictures transmitted from Swantic-LI had been accurate after all. From a distance of a million kilometres, the shape of the Sleeping God was quite unmistakable: two concave conical spires end to end, three and a half thousand kilometres in length. The perfectly symmetrical geometry betrayed its artificial origin. The central rim was sharp, appearing to taper down to an edge whose thickness was measured in molecules; its tips had an equally rapier-like profile. There wasn’t anyone on board *Lady Mac* who didn’t have an uncomfortable vision of the starship being impaled on one of those sleek spikes.

Beaulieu launched five astrophysics survey satellites towards it. Fusion-powered drones with multi-discipline sensor arrays, they arched away from the starship on

trajectories that would position them in a necklace around the Sleeping God.

Joshua led the whole crew down to the lounge in capsule C where Alkad, Peter, Renato, and Kempster were gathered to interpret the data from the satellites and *Lady Mac*'s own sensor suite. Samuel, Monica, and one of the serjeants had also joined them.

Studio-quality holographic screens sprouted from the consoles installed to process the astrophysical data. Each one carried a different image of the Sleeping God, they were tinted every shade in the rainbow, as well as providing graphic representations. Their main AV projector showed the raw visual-spectrum picture, materializing it in the middle of the compartment. The Sleeping God gleamed alone in space, sunlight bouncing off its silver surface in long shimmers. That was the first anomaly, though it took Renato a full minute of puzzled study to see the obvious.

"Hey," he exclaimed. "There's no darkside."

Joshua frowned at the AV projection, then accessed the console processors directly to check. The satellites confirmed it: every part of the Sleeping God was equally bright, there were no shadows. "Is it generating that light internally?"

"No," Renato said. "The spectrum matches the star. Light must be bending round it somehow. I'd say it has to be a gravitational lens, an incredibly dense mass. That ties in with the Tyrathca observation that it's a spatial disturbance."

"Alkad?" Joshua asked. "Is it made out of neutronium?" That would be the final irony if a God was made from the same substance as her weapon.

"A moment, Captain." The physicist seemed troubled. "We're getting the data from the gravitational detectors on line." Several hologram screens flurried with colourful icons. She and Peter read them in surprise. They turned in unison to stare at the central projection.

"What is it?" Joshua asked.

“I would suggest that this so-called God is actually a naked singularity.”

“No fucking way!” Kempster said indignantly. “It’s stable.”

“Look at the geometry,” Alkad said. “And we’re detecting a torrent of gravitational wave vacuum fluctuations, all of them at very small wavelengths.”

“The satellites are picking up regular patterns in the fluctuations,” Peter told her.

“What?” She studied one of the displays. “Holy Mary, that’s not possible. Vacuum fluctuations have to be random, that’s why they exist.”

“Ha,” Kempster grunted in satisfaction.

“I know what a singularity is,” Joshua said. “The point of infinite mass compression. It’s what causes a black hole.”

“It’s what causes an event horizon,” Kempster corrected. “The universe’s cosmic censor. Physics, mathematics—they all break down in the infinite, because you can’t have the infinite, it’s unobtainable in reality.”

“Except in some very specific cases,” Alkad said. “Standard gravitational collapse in stars is a spherical event. Once the core has compressed to a point where its gravity overcomes thermal expansion, everything falls into the centre from all directions at once. The collapse finishes with all the matter compressing into your infinity point, the singularity. At which time its gravity becomes so strong that nothing can escape, not even light: the event horizon. However, in theory, if you spin the star before the event, the centrifugal force will distort the shape, expanding it outward along the equator. If it’s spinning fast enough, the equatorial bulge will remain during the collapse.” Her finger indicated the projected image. “It will form this shape, in fact. And right down at the very end of the collapse timescale, when the star’s matter has all achieved singularity density, it will still be in this shape, and for an instant, before the collapse con-

tinues and pulls it into a sphere, some of that infinite mass will project up outside the event horizon.”

“For an instant,” Kempster insisted. “Not fifteen thousand years.”

“It looks as though someone has learned how to freeze that instant indefinitely.”

“You mean like the alchemist?” Joshua datavised to her.

“No,” she datavised back. “These kind of mass-densities are far outside any I achieved with the alchemist technology.”

“If its mass is infinite,” Kempster recited pedantically, “it will be cloaked in an event horizon. Light will not escape.”

“And yet it does,” Alkad said. “From every part of the surface.”

“The vacuum fluctuations must be carrying the photons out,” Renato said. “That’s what we’re seeing here. Whoever created this has learned how to control vacuum fluctuations.” He grinned in wonder. “Wow!”

“No wonder they called it a God,” Alkad said in veneration. “Regulated vacuum fluctuations. If you can do that, there’s no limit to what you can achieve.”

Peter gave her a private, amused look. “Order out of chaos.”

“Kempster?” Joshua queried.

“I don’t like the idea,” the old astronomer said with a weak grin. “But I can’t refute it. In fact, it might even explain Swantic-LI’s jump to another star. Vacuum fluctuations can have a negative energy.”

“Of course,” Renato said. He smiled eagerly at his boss, catching the idea quickly. “They’d be exotic, that’s the state which holds a wormhole open. Just like a voidhawk’s distortion field.”

Samuel had been shaking his head as the discussion ploughed onwards. “But why?” he said. “Why build something like this, what is it for?”

"It's a perpetual source of wormholes," Alkad said. "And the Tyrathca said it assists the progress of biological entities. This is the ultimate stardrive generator. You could probably use it to travel between galaxies."

"Christ, intergalactic travel," Liol said dreamily. "How about that?"

"Very nice," Monica retorted. "But it hardly helps us to deal with possession."

Liol gave her a pained glance.

"Okay," Joshua said. "If you guys are right about this being an artificially maintained naked singularity, there must be some kind of control centre for the vacuum fluctuations. Have you found that yet?"

"There's nothing out there except the singularity itself," Renato said. "Our satellites are covering all of the surface. Nothing hiding on the other side, nothing in orbit."

"There has to be something else. The Tyrathca got it to open a wormhole for them. How do we do that?"

His neural nanonics reported a new communication channel opening. "You ask," the singularity datavised.

The cloud's luminosity remained constant, but its shading had shifted a long way down the spectrum as Louise approached its epicentre. When she walked across the paved plaza outside St Paul's cathedral every surface was toned a deep crimson. Stone carvings embellishing the beautiful old building cast long black shadows down the wall, ebony jail bars gripping it tightly, squeezing away the last remnants of sanctity.

Her escort pranced around her like insane Morris dancers, inviting her onward with mocking gestures. The snarls of thunder ended as she reached the large oaken doors, leaving an onerous silence. Louise walked into the cathedral.

She took a couple of steps forward, then faltered. The doors closed behind her with a ululation of cold air. Thousands of possessed were standing waiting along the nave,

dressed in elaborate costumes from every era of human history and culture, each one completely black. They were all facing her. The organ began to play, blasting out a harsh hard-rock version of the wedding march. Louise put her hands over her ears, it was so loud. All the possessed turned to face the altar, leaving a narrow passage clear down the very centre of the nave. She began to walk down it. It wasn't a conscious thing, her limbs did as they were commanded by the massed will of the possessed. Her anti-memory weapon fell from numbed fingers after she'd taken the first few steps, clattering away over the cracked tiles.

Ghosts drifted towards her, hands held out to implore. They swept past her as she carried on walking, shaking their heads in sorrow.

The music ended when she reached the front row of the possessed. They were standing level with the cathedral's transept wings; ahead of them, the floor underneath the vaulting central dome was empty. Iron braziers with foul-smelling fires were lining the walls, their black smoke smudging the pale stonework. She couldn't actually see the apex of the dome, it was obscured by a pall of grey fug. There was a gallery high above her. Several people leaned on its rail, looking down at her with mild interest.

Her compulsion ended, and she tottered forward.

"Hello, Louise," Quinn Dexter said. He stood in front of the defiled altar, no part of him visible within the black robe.

She took a couple of unsteady steps. Fear was tightening every muscle, turning her body stiff. She wasn't even certain she could stand for much longer. "Dexter?"

"None other." He moved to one side, allowing her to see a man's body spread-eagled across the altar. "And now God's Brother has brought the three of us together again."

"Fletcher," she squeaked.

Quinn held out an arm towards her and extended a swan-

white hand. A claw finger beckoned, granting her permission to approach.

The lacerations and dried blood coating his skin made her afraid. But as she drew closer she saw his muscles were bunched and trembling. An unfamiliar face was contorted with distress, sucking down air in fast pain-filled gulps.

“Fletcher?”

Quinn waved his hand, and the electricity was turned off. The body slumped down onto the stone, panting in shock. Slowly, Fletcher’s face emerged to replace the blooded features. The chains and metal bands securing him dropped away. All of the wounds were banished from sight as his customary naval uniform materialized. He climbed down gingerly from the altar.

“My dearest lady. You should not have come.”

“I had to.”

Quinn laughed. “Your call, Fletch. You can walk out of here with her now if you make the right decision. If not, she’s all mine.”

“My lady.” Fletcher’s face was riven with anguish.

“Why can you walk out?” she asked.

“He’s just got to sign up for the army of the damned,” Quinn said. “I won’t even make him do it in blood.”

“No,” she said. “Fletcher, you mustn’t do that. I came here to warn you all. This has to stop. You have to disperse the red cloud.”

“Is that a threat, Louise?” Quinn asked.

“You’ve frightened Govcentral with the red cloud. They think you’re going to take the Earth away from the universe. The President won’t let that happen. He’s going to use Strategic Defence weapons against London. Everyone will die. Millions and millions of people.”

“I won’t,” Quinn said.

“But they will.” Louise waved an arm back at the silent ranks of his disciples. “Without them you’re nothing.”

Quinn glided up to Louise. His face slipped out of the robe's shadows to show her his furious expression. "God's Brother, I hate you!" He slammed his hand across the side of her head, using energistic power to amplify the strength of the blow.

Louise screamed at the pain, flying back to crash into the altar. She crumpled forward onto the floor, whimpering as blood pumped into her mouth.

Fletcher made a start forwards, finding the end of Quinn's anti-memory weapon pressed against his nose. "Back off, fuckhead," Quinn snarled. "Back!"

Fletcher retreated, breathing heavily.

Quinn glared down at Louise. "You came here to save people. People you've never seen. People you'll never know. Didn't you?"

Louise was sobbing from the pain, holding a hand to her face. Blood ran out of her mouth, dripping onto the floor. She looked up at him, devoid of understanding.

"Didn't you?"

"Yes," she wept.

"I hate that *decency*. This assumption you have that you can connect with me on some level, because underneath I'm human too, that I have a heart. And in the end I'm going to be reasonable. That of course I'll back down and talk things out with the supercop fucks who've been shooting at my ass ever since I got back to this stinking garbage dump of a planet. That's why I hate you, Louise. You are the end product of a religion which has systematically set about shackling the serpent beast for over two and a half thousand years. Religions, all religions, forbid our true nature to shine through, they waken us so that we'll spend our whole lives grovelling in front of the false Lord. That's the path you embrace, Louise, that's what you are: kind hearted. Just by existing you are the enemy of the Light Bringer. My enemy. I hate you so badly I'm in pain from it. And you'll pay for that. Nobody hurts me and goes off to laugh about it with their friends. I'll make you

the army's whore. I'll make every one of my followers fuck you. They'll keep on fucking you until your mind shatters and your heart bursts. Then when there's nothing left but a lump of insane meat bleeding its life away into the gutter I'll use the soul-killer to eradicate what's left of you from the universe, because there's no way I'll ever share a single night in hell with you. You're not that worthy."

Louise shrank away from him, crabbing across the floor until she was backed up against the altar. "You can do all that, you can hurt me until I denounce everything I believe in. But you will never change what I am right now. And that's all that matters. I'm true to me. I've already had my victory."

"Dumbass bitch. That's why you and your false Lord will always lose. Your victory's in your head. Mine is physical. It's as motherfucking real as you can get."

Louise looked defiantly at Quinn. "When evil rules, then it will be goodness which corrupts you."

"Total bollocks. The likes of you won't be able to corrupt the army I'm bringing onto the field. Tell her Fletcher, be *honest* with her. Is my army going to win? Is the Night coming?"

"Fletcher?" she appealed.

"My lady . . . I . . ." His head drooped in abject despair.

"No," Louise gasped. "Fletcher!"

Quinn watched her, grinning in ferocious satisfaction. "Ready to watch the bad part, now?" He reached down, and grabbed her shoulder, hauling her to her feet.

"Unhand her," Fletcher demanded. A ball of solid air slammed into his belly, its impact firing pain down every nerve in his host body. He was thrown off the ground and sent tumbling backwards. Even when he landed hard on the tiles he kept skidding as if the surface was ice. When he stopped moving and regained his wits, he found he was directly under the apex of the dome.

"Don't move," Quinn ordered.

A pentagon of tall white flames burst into existence around Fletcher to emphasise the point. He watched helplessly as Quinn dragged Louise along into the south transept. They went through a door.

There were stairs inside, spiralling upwards. Louise had to run to keep up with Quinn. The curving stairs went on and on, making her feel dangerously dizzy; and the pain from the side of her head was so intense she thought she was going to vomit.

They came out through a narrow archway onto the gallery ringing the dome. Quinn moved round it until he was facing down the nave. He thrust Louise towards a young girl in a leather waistcoat and pink jeans.

“Look after her,” he said.

At first Louise thought Courtney was a possessed; her hair was bright emerald, all of it standing on end and twirled into flame-like spikes. But there were scabs all over her cheeks and arms, unhealed and starting to fester; one eye was swollen almost shut.

Courtney giggled as she held Louise tight. “I get you first.” Her tongue licked round Louise’s ear, hands closing tight on her buttocks.

Louise moaned as her legs gave out.

“Shit.” Courtney pushed her back onto the low bench which ran around the gallery.

“We won’t live long enough for that,” Louise said harshly.

Courtney gave her a puzzled look.

Quinn put his hands on the rail and looked down on his silent obedient followers packed into the nave. Fletcher Christian stood still at the centre of the flaming pentagram, head bent back so he could observe the gallery. Quinn gestured and the prison of white flames vanished, leaving Fletcher alone on the floor.

“Before the Night dawns, there’s one person missing from our gathering,” Quinn announced. “Though I know he’s

here. You're always here, aren't you?" The silken tone of displeasure made his followers stir uneasily.

Quinn signalled the acolyte on the gallery, who led Greta round to him. She was pushed hard against the rail, almost going over. Quinn grabbed her by the scruff of her neck, tipping her head upright. Lank hair dangled down over her face as she drew a shaky breath.

"Say your name," Quinn told her.

"Greta," she mumbled.

He took the anti-memory weapon from his robe and shoved it against her eye. "Louder."

"Greta. I'm Greta Manani."

"Oh Daddy," Quinn called out. "Daddy Manani, come out, come out wherever you are."

The possessed crowded into the nave began to look round. Murmurs of confusion seeped out among them. Quinn scoured their heads for someone moving.

"Get out here, fuckhead! RIGHT NOW. Or I kill her soul. You hearing me?"

The sound of lone footsteps echoed through the cathedral. The hushed possessed parted in a smooth tide to allow Powel Manani through. The Ivet supervisor looked exactly the same as the last time Quinn had seen him back on Lalonde, a brawny man dressed in a red and green checked shirt. He walked out under the dome, put his hands on his hips and grinned up at Quinn. "I see you're still a total loser, Ivet."

"I'm not a fucking Ivet!" Quinn screamed. "I'm the Messiah of Night."

"Whatever. If you harm my daughter, Messiah of dick-heads everywhere, I'll personally finish the job Twelve-T started on Jesus."

"I have been harming her. For a long time now."

"Bet it isn't as bad as what we did to your friends Leslie and Kay, and all the other Ivets we caught."

For a second Quinn contemplated vaulting over the rail

and swooping down on the supervisor, feeding his serpent beast. The peak of rage subsided. That was what Manani probably wanted. Quinn could sense how strong the man's energistic power was. Using him as the sacrifice to the summoned dark angles was going to be much more satisfying.

"If you kill her," Powel said, "you have no protection from me. And if you blast this body to pieces, I'll just come back again like before. I'm going to keep on coming back until this is settled between us."

"I'm not going to blast you out of your body, not after the grief you've caused me. I'm not that nice, remember. Now you stay exactly where you are, or I will kill your daughter's soul."

Powel looked round the empty expanse of floor under the dome as if he was viewing an apartment. "Guess you're on his shit list too, huh," he said to Fletcher.

"I am, sir."

"Don't worry, he'll make a mistake. He's not smart enough to pull off something like this. And when it all goes pear-shaped, his balls are mine."

Quinn spread his arms wide in an open embrace to the assembled possessed below. "Now that everyone's here," he said, "we'll begin."

Joshua managed to suppresses his shock without any help from programs. He knew the importance of this moment was too great for anything other than perfect clarity. "Are you the Tyrathca's Sleeping God?" he datavised.

"You know I am, Captain Calvert," the singularity replied.

"If you know who I am, then the Tyrathca were correct saying that you see the universe."

"The universe is too large for that, of course, but to reply in context, yes, I observe as much of the universe as you are aware of, and a great deal more besides. My quantum struc-

ture enables an extensive interconnection with a large volume of space-time and other realms.”

“Not one for small talk, is it,” Liol muttered.

“Then you know my species is being possessed by the souls of our own dead?” Joshua asked.

“Yes.”

“Is there a solution to this problem?”

“There are a great many solutions. As the Kiint have hinted to you, each race comes to terms with this aspect of life in its own way.”

“Please, do you know of one that’s applicable to us?”

“Many are. I am not being deliberately obtuse. I can list them all, and I can and will assist you in applying them where relevant. What I will not do is make the decision for you.”

“Why?” Monica asked. “Why are you helping us? It’s not that I’m ungrateful. But I am curious.”

“The Tyrathca were also correct when they said I exist to assist the progress of biological entities. Though the particular circumstances humans are currently facing were not the reason I was created.”

“Then what were you made for?” Alkad asked.

“The race which created me had reached their evolutionary pinnacle; intellectually, physically, and in their technology. A fact which should be self-evident to you, Dr Mzu. My sentience resides within a self-contained pattern of vacuum fluctuations. This provides me with an extensive ability to manipulate mass and energy; for me thought is deed, the two are one and the same. I used that ability to open a gateway for my creators into a new realm. They knew little of it, other than it existed; its parameters are very different to this universe. So they chose to embark on a new phase of existence living within it. They left this universe a long time ago.”

“And you’ve been helping various species progress along evolution’s track ever since?” Joshua said. “It’s your reason for existing?”

“I do not require a continuing reason to exist, a motivation. That psychology is a descendent of a biological sentience. My origins are not biological; I exist because they created me. It’s that simple.”

“Then why do you help?”

“Again, the simple answer would be because I can. But there are other considerations. It is an amplification of the problem your species has encountered millions of times during its history, almost daily in fact. You were even subject to it at Mastrit-PJ. When and where not to intervene? Did you believe you did the right thing by giving the Mosdva ZTT technology? Your intentions were good, but ultimately they were governed by self interest.”

“Did we do the wrong thing?”

“The Mosdva certainly don’t think so. Such judgements are relative.”

“So you don’t help everybody all the time?”

“No. Such a level of intervention—shaping the nature of biological life to conform with my wishes, however benevolent—would make me your ruler. Sentient life has free will. My creators believe that is why this universe exists. I respect that, and will not interfere with its self determination.”

“Even when we make a mess of things?”

“That would be a judgement again.”

“But you are willing to help us if we ask?”

“Yes.”

Joshua looked at the projected image of the singularity, vaguely troubled. “All right, we’re definitely asking. Can we have the list of solutions?”

“You may. I would suggest they would be more useful if you understood what has happened. That way, you would be able to make a more informed decision on which one to apply.”

“Seems reasonable.”

“Wait,” Monica said. “You keep mentioning we have to make a decision. How do we do that?”

“What are you talking about?” Liol asked. “Once we’ve heard what’s on offer, we chose.”

“We do? Are we going to put it to a vote here in the ship, do we go back to the Confederation Assembly and ask them to decide? What? We need to be certain about this first.”

Liol looked round the cabin, trying to identify the mood. “No, we don’t go back,” he said. “This is what we came here for. The Jovian Consensus thought we were up to the job. So I say do it.”

“We’re deciding the future of our whole race,” she protested. “We can’t just leap into this. And . . .” she indicated Mzu. “Bloody hell, she’s hardly qualified to be passing judgement on the rest of us. That’s the way I see it. You were going to use the Alchemist against an entire planet.”

“Whereas the ESA is an organization of enviable morality,” Alkad snapped back. “How many people did you murder just tracking me down?”

“You people have got to be fucking kidding,” Liol said. “You can’t even decide how to decide? Listen to yourselves! This kind of personal stupidity is what dumps humans into the shit every time. We just discuss it and make a decision. That’s it. Finish.”

“No,” Samuel said. “The captain decides.”

“Me?” Joshua asked.

Monica stared at the Edenist in astonishment. “Him!”

“Yes, I agree,” the serjeant said. “Joshua decides.”

“He never doubted,” Samuel said. “Did you, Joshua? You’ve always known this would end in success.”

“I hoped it would, sure.”

“You doubted this flight,” Samuel told Monica. “You didn’t fully believe it would end in success. If you had, you would have been prepared to make the decision. Instead,

you have doubts, that disqualifies you. Whoever does this must have conviction.”

“Like yours, for instance,” Monica said. “A subset of your famous rationality.”

“I too find myself unqualified for this. Although Edenists think as one, to make a decision of this magnitude I find myself wanting the reassurance of the Consensus. It would seem Edenism has a flaw after all.”

Joshua gazed round at his crew. “You’ve all been very quiet.”

“That’s because we trust you, Joshua,” Sarha said simply, and smiled. “You’re our captain.”

Strange, Joshua thought, when you got right down to the naked truth, people actually had faith in him. Who he was, what he’d achieved, meant something to them. It was quite humbling, really. “All right,” he said slowly. He datavised the singularity: “Is that acceptable to you?”

“I cannot take responsibility for your decisions, collective or otherwise. My only constraints are that I will not permit you to use my abilities as a weapon. Other than that, you have free access.”

“Okay. Show me what happened.”

The possessed in the nave had dropped to their knees, concentrating hard on producing the stream of energistic power which the dark Messiah demanded from them for his summoning. Up on the gallery facing them, Quinn’s robe evaporated into pure shadow and began to flow out from his body, filling the air around him like a black spectre. At the heart, his naked body gleamed silver. He accepted the offering from his followers, and directed it as he pleased. It spilled down across the floor below the cathedral’s dome, prying at the structure of reality, weakening it.

Powel Manani and Fletcher Christian looked down at their feet in consternation as the tiles around them sprouted

a luminous purple haze. The soles of their shoes became enmeshed with the surface, making it hard to lift their feet up.

"I need to get near him," Powel said.

Fletcher glanced up at the swarthy occultation looming above. "I wish to be as far from this dread place as possible. But I will not leave without her."

Powel exerted his own energistic power to yank his feet clear of the tiles. Even then it took considerable effort to move them. He shuffled right up in front of Fletcher, the two of them almost touching. The bottom of his sweatshirt was lifted a couple of centimetres, revealing Louise's anti-memory weapon shoved into the top of his waistband.

"Very well," Fletcher said. "But it will be no easy endeavour. I hear the fallen angels approaching."

The haze was thrumming, issuing a howl of lament and greed. Below that, the fabric of the universe was thinning in accordance with Quinn's desire. They could both feel pressure being exerted from the other side, a desperate scrabbling.

"Not good," Powel said. The tiles were becoming insubstantial. He pulled his feet out again; they'd sunk several centimetres below the surface.

"I will make a stand and distract him," Fletcher said. "You may have time to reach the stairs."

"I don't think so. This stuff is getting worse than quicksand."

The purple haze vanished. Fletcher and Powel looked round wildly. A drop of ectoplasm dribbled up in a crack between two tiles, making a soft *blup*. A patch of dense white frost solidified around it.

"Now what?" Powel grunted with apprehension.

More ectoplasm was bubbling up. Sluggish rivulets began to form as it ran together. The tiles left uncovered had all turned sparkling white from frost. Fletcher could feel cold air rushing off the sludgy fluid. His breath had become hoary.

"Welcome, my brothers," Quinn's voice boomed across

the cathedral. "Welcome to the battlefield. Together we will bring down the Night of our Lord."

The entire area of floor underneath the dome had become a pool of burping and foaming ectoplasm. Fletcher and Powel were hopping from foot to foot, frantically trying to banish the excruciating cold from their legs. They suddenly stood still, tensing as a V-shaped ripple moved across the pool. Waves of hot, lustful emotion were surging up from the dimensional rift in counter to the physical cold. A curving spike lifted up out of the floor, ectoplasm flowing along its length. It was over three metres high.

Fletcher watched it rise in horrified awe. Another one was emerging at the side of it, ectoplasm gurgling loudly as it lapped against the base.

"Lord Jesus protect your servants," he whispered. He and Powel backed away from the twin spikes as a third one budded.

The ectoplasm was bubbling energetically now. Smaller tendrils were writhing up, erupting all over the pool like a fur of rapacious cilia. One started to curl round Powel's leg. With a cry he managed to stumble away from it. The tip blossomed into a snapping five-talon claw. He pointed a finger at it and flung a slim blast of white fire. The claw shuddered, and large ripples of ectoplasm surged towards it.

"Stop!" Fletcher shouted hoarsely. The ectoplasm licking its way up his legs was doing far more than freezing his flesh, he realized. His mental strength was reducing, and with it his energistic power.

The claw's talons had almost doubled in size under the impact of the white fire. Powel snatched his hand back, watching anxiously as the claw groped round blindly.

Quinn laughed in delight as he watched the desperate antics of his sacrificial victims. There were five of the huge spikes now; they started to lean over. He wondered if they were the tips of some creature's fingers.

Moans of alarm were coming from the possessed down in the nave as they realized what they were witnessing. The first signs of panic were evident as the front rank pressed back from the edge of the ectoplasm pool.

“Hold fast!” Quinn thundered at them. The opening into darkness wasn’t yet complete, it fluctuated as those below hurled themselves against it. Quinn concentrated his mind on the area where reality was distorted to breaking point.

A huge bubble of noxious fumes burst from the centre of the ectoplasm, releasing an undulating spume of smaller ones. Powel and Fletcher ducked as a spray of ectoplasm splattered outwards. Tendrils of the stuff were wriggling against their legs now. Moving had become almost impossible, the agonising cold was squeezing in against their limbs and chests.

A dark mass slowly shrugged its way out of the subsiding froth of bubbles. It was a metallic sphere with boxes and cylinders jutting out at odd angles. Streaks of molten nulltherm insulation were running down its sides, mingling with the wreath of ectoplasm that drooled away in slippery ribbons.

“What the fuck is that?” Quinn demanded.

Explosive bolts *cracked* loudly, and a circular hatch flew away from the sphere. A fat man in a grubby toga jumped down, splashing into the ectoplasm pool without any noticeable discomfort.

Dariat looked round at his surroundings with considerable interest. “Bad timing?” he asked.

Tolton walked straight through the escape pod’s walls. He stood in the ectoplasm and let out a grateful sigh. Fletcher watched in fascination as the ectoplasm flowed up him, turning the ghost solid. He seemed so much more *vital* than any of the other entities struggling to fruit from the ectoplasm.

Powel Manani’s deep laugh rocked the air. “These are your terrifying warriors?” he mocked.

Quinn yelled in fury and sent a white fireball ripping down at the derisive Ivet supervisor. A couple of centimetres

from Powel it fractured into screeching webs of energy that never quite managed to touch him. The ectoplasm heaved enthusiastically as the crackling tips plunged into it.

A long frond of the stuff leapt up to whip round Powel's chest. Thicker, blunt tendrils were embracing his legs, knitting together. They began to pull him downwards. "How do we kill this stuff?" he shouted at Dariat. It had taken a worrying amount of effort to deflect Quinn's firebolt; his strength was draining away rapidly.

"Fire," Dariat called back. "Real fire works against them."

Something was lumbering up out of the pool next to Tolton, a creature five times his size, seven limbs unfolding from its flanks. He looked at Dariat, and the two of them linked hands. They sent a single bolt of white fire streaking into the base of the escape pod. The last two solid rocket motors ignited.

The events into which Joshua plunged had a form similar to a sensewise. They were real enough as they unravelled around him, but he witnessed them all simultaneously. At the same time, he could stand back and evaluate what was happening. That wasn't an ability the human mind could perform.

"You are using my thought processing ability," the singularity informed him.

"Then I'm no longer human. It will be you who makes the decision."

"The essence of what you are remains unchanged. I have simply expanded your mental capacity. Consider this a supercompressed history didactic."

So Joshua stood at Powel Manani's side on Lalonde as Quinn Dexter performed the sacrifice and the Ly-cilph opened a gateway into the beyond, allowing the first souls to pour through. The possessed multiplied their numbers and spread down the Juliffe. He watched Warlow talking to Quinn Dexter at Durringham spaceport and accept the payment for *Lady Mac* to carry him to Norfolk.

Ralph Hiltch took flight to Ombey and unleashed the possession of Mortonridge. The liberation followed on, with Ketton island vanishing into another realm.

“Are you the instrument that transferred the crystal entities there?” Joshua asked.

“No. That was another similar to myself. I am aware of several within this universe, though all are in superclusters very distant from here.”

Valisk and its descent into the melange. Pernik. Nyvan. Koblat. Jesup. Kulu. Oshanko. Norfolk. Trafalgar. New California. André Duchamp. Meyer. Erick Thakara. Jed Hinton. Other places, worlds and asteroids and ships and people; their lives wound together into a cohesive whole. Jay Hilton’s unauthorised escape to the Kiint home system. Their remarkable arc of planets, housing the retired observers who gathered in front of Tracy’s television, dunking chocolate biscuits into their tea as they watched the human race falling apart.

“Dick Keaton,” Joshua said with mild jubilation. “I knew there was something odd about him.”

“The Kiint use many specially bred observers to gather data on different species,” the singularity said. “For all their scientific prowess, they do not have my perceptive faculty. Corpus still utilises technology to amass its information. Such methods can hardly be absolute.”

“Did they find you?”

“Yes. I could do nothing for them, and told them so. One day they will be able to build my like by themselves. Not for some time, though. There is no need. They have achieved an admirable harmony with the universe.”

“Yeah, so they keep telling us.”

“Not to taunt you. They are not a malicious species.”

“Can you show me the beyond as well?” Joshua asked. “Can you tell me how to travel through it successfully like they do?”

“It has no distance,” the singularity said. “It only has time. That is the direction in which you must travel.”

“I don’t understand.”

“This universe and all it is connected with will come to an end. Entropy carries us towards the inevitable omega point, that is why entropy exists. What is to be born next cannot be known until then. This is the time when the pattern of that which replaces it will be created, a pattern which will emerge out of mind, the collective experience of all who have lived. That is where souls go, their transcendence brings all that they are together into a single act of creation.”

“Then why do they get stuck in the beyond?”

“Because that is where they want to be; like the ghosts wedded to the place of their anguish, they refuse to discard the part of their life which is over. They are afraid, Joshua. From the beyond they can still see the universe they have left behind. All they have known, the condition that they were, everyone they have loved, is still obtainable, so very very close to them. They fear to leave that for the unknown future.”

“All of us are frightened of the future. That’s human nature.”

“But some of you venture into it with confidence. That’s why you are here today, Joshua, that’s why you found me. You believed in the future. You believed in yourself. That is the most precious possession any human can ever own.”

“That’s it? That’s all there ever was? Faith in yourself?”

“Yes.”

“Then why in God’s name didn’t the Kiint tell us that? You said they weren’t malicious. What possible reason can they have for denying us that? A few simple words.”

“Because you have to implement that knowledge as an entire species. How you do that is your own decision.”

“It’s a bloody simple decision. You just tell them.”

“Telling someone not to be afraid is one thing. To have them believe it at an instinctive level is quite another. In

order not to be afraid of the beyond you must either understand its purpose, or have the naked conviction to move on once you encounter it. How many of your race are uneducated, Joshua? I don't mean those of you alive now, I mean throughout history. How many have lived unfulfilled lives? How many have died in infancy or in profound ignorance? You don't have to tell the rich and the educated, the privileged, they are the ones who will begin the great journey through the beyond of their own accord. It is the others you must convince, the ignorant masses, yet paradoxically, they are the ones hardest for you to reach. Theirs are the minds which, thanks to circumstance, have set and hardened against new concepts and ideas from an early age."

"But they can still be taught. They can learn to believe in themselves, everyone can. It's never too late for that."

"You speak of high idealism, but still you have to implement your ideals in the real, practical world. How will you reach these people? Who will pay to provide every one of them with a personal tutor, a guru who will advance their inner spirit?"

"Jesus, I don't know. How did other races do it?"

"They developed socially."

"The Laymil didn't, they committed suicide."

"Yes, but by that time they understood the nature of the beyond. Every one of them took the leap forward knowing that they still had a future. Their suicide was not racial extermination, a method of simply thwarting their possessing souls; they carried what they are to the omega point as one. That is what their communal society permitted them to do."

"I get it. The Laymil possessing souls were from a time before they reached that communal society."

"Yes. As most of your possessed are from earlier times. But not all, not by any means. Your race has not eliminated poverty, Joshua. You have not liberated people from physical drudgery to develop their minds. If you have a flaw in your

nature, then it is that. You cling to what is comfortable, the old familiar. I suspect that is why humans have a slightly higher than average percentage of souls lingering in the beyond.”

“We’ve done pretty well in the last thousand years,” he said, irked. “The Confederation is one vast middle-class estate.”

“The parts you travel to are. And even there ‘comfortable’ does not equate to ‘satisfactory.’ You are not animals, Joshua. Yet the entire population on some of your planets perform mundane agrarian tasks.”

“It costs to build automated factories. Global economies have to develop to a level where it becomes affordable.”

“You have the technology to travel between the stars, and all you do when you get to your fresh world is start the old cycle over again. Only one new type of society has emerged in the last thousand years, the Edenists; and even they participate and perpetuate your economic structure. The nature of society is governed by economic circumstance; and for all of your vast collective wealth, for all your knowledge, you remain stagnant. Throughout your voyage here you and your crew discussed how the Tyrathca were so slow to change compared to humans. Now you have seen the Kiint home system, how far ahead of you do you think their technology lies? It is a small gap, Joshua. Molecular-level replicator technology would bring about the end of your entire economic structure. If you wanted to, how long do you think it would take the combined scientific resources of the Confederation to build a prototype replicator?”

“I don’t know. Not long.”

“No. Not long. The knowledge is there, but you lack the will. Although there is one final inhibiting factor we haven’t incorporated yet into your knowledge base. And it’s an important one.”

“I have my suspicions about you,” Joshua said. “You with your avowed non-interventionist policy.”

“Yes?”

“How did I get here?”

“By chance.”

“A very long chance. A Tyrathca arkship is damaged while entering a star system devoid of any mass. Thousands of years later during the possession crisis we hear about something which might be able to solve the crisis for us. Would you like to compute the odds of that happening?”

“There are no odds, there is only cause and effect. The Tyrathca didn’t inform you of the Sleeping God when you first encountered them, because until the human possession crisis started they had no need to pray to it. You found me because you looked, Joshua. You believed I existed. Quinn Dexter has found his army of darkness, because he too has conviction. Greater than yours, I would suggest. Was he led to them by omnipotent entities playing chess with lives?”

“All right. But you’ve got to admit, having you this close to the Confederation is a hell of a coincidence given there’s only one of you per galactic supercluster.”

“That is not a coincidence, Joshua. I am aware of everything, because I am connected to everything. When you search for me, and have sufficient faith that you will find me, then you will succeed.”

“Okay. Well, if I haven’t said it before: thank you. I’ll do my best to see your faith isn’t misplaced. Now, what was that last factor?”

The singularity showed him, delivering his awareness to the orbital tower down which he rode down to Earth, with B7, Quinn Dexter, and . . .

Joshua’s eyes flicked open. His crew broke off their conversations, looking at him in anticipation.

“Louise,” he said. And vanished.

Thick smoke and blinding yellow flame exploded out of the escape pod rocket motors. The noise was a sheer wall of energy that sent Fletcher and Powel flailing backwards. Light

punched down into Fletcher's eyes as he used the remnants of his energetic power to ward off the blast.

The escape pod wobbled upwards, gathering speed. Flame splayed out from its base, scouring the surface of the ectoplasm pool. Embryonic shapes melted away under the incendiary heat. A cloud of clammy fumes billowed out, hurtling down the nave and both transepts. Brittle, ancient stained-glass windows shattered under the tremendous pressure. Horizontal jets of smoke and ectoplasm smog roared out over the deserted plaza.

The escape pod smashed into the top of the cathedral dome and crashed through into the pre-dawn morning. Its trajectory was given a savage kick by the impact, sending it racing away in a low curve underneath the red cloud, out towards Holborn.

Down on the floor of the cathedral, it was impossible to see anything. The air was coagulated with icy particles and vile acidic smoke. Fletcher sloshed about in the raging ectoplasm pool, trying to find anything that would give him his bearings. His mind could sense the possessed in the nave: their fear-ordered discipline was starting to crumble. Apart from them, nothing was clear. Chunks of debris were whistling down from above, splattering down into the turbid fluid where they immediately cracked open from the cold.

"Anybody left standing?" Powel shouted somewhere in the murk.

A vermilion glimmer began to pervade the churning mist as the light from the red cloud shone in through the gaping windows. Folds of darkness slipped across Fletcher's vision. He stood still, not daring to move.

Powel bumped into him. Both of them jumped.

"I've got to get up to the gallery," Powel said. "This is our chance, he'll be as blind as us."

"I think the door is this way," Fletcher told him. Even

using his energetic power to bolster his legs, they moved reluctantly. He could feel nothing below his knees.

The mist began to scintillate with white light. It abruptly turned heavy, sighing as it sank to the ground. The rumpled upper surface descended around Fletcher, leaving him totally exposed. A wide beam of red light shone down through the hole in the dome, illuminating the whole ectoplasm pool. On the other side, Dariat and Tolton were caught in the act of trying to reach the north transept.

“Going somewhere?” Quinn asked. “There’s nowhere to run. The warriors of the Light Bringer are here.” With a theatrical motion, he gestured at the pool, conjuring its inhabitants up.

A vast upwelling of ectoplasm sent waves of the fluid pouring lazily down the nave and transepts. The crown of an Orgathé slipped smoothly upwards, emerging into the crimson light.

Quinn laughed uproariously as the monster rose into the universe. Possessed fled screaming through the cathedral doors. Powel and Fletcher were drowning in undead sludge that sent out eager pseudopods to smother their heads. At his feet Louise and Greta lay broken and defeated, shedding tears for the torment to come. It was Night as he’d always dreamed it would be.

Something *happened* far above him. His head jerked up. “Fuck!”

Andy Behoo had spent the whole time pressed against his window, watching the ugly red cloud creeping across London. Hot air helped to magnify the incursion with awful clarity. Above the arcology’s crystal dome, the stars shone down with cold beauty through a storm-free sky. It would have been a lovely dawn.

Now he knew he wouldn’t even see that. His neural nanonics had crashed. The front edge of the cloud was less

than a quarter of a mile away. Underneath it, the eerily pervasive red light helped to illuminate the vacant streets.

He'd clung to this window when she left, staring after her mutely; so he knew which street she'd taken. If she came back, he would be able to see her. That alone would give him the courage to leave the tenement. He would go out and fetch her home. Louise would make the end liveable.

The crimson light inside the cloud flickered and died. It was so sudden Andy thought there was something wrong with his eyes. All that remained of the frightened city were outlines so faint he could be imagining them. He scoured them for signs that the SD weapons had begun their slaughter.

Nothing moved in the dead silence. He looked up.

There were no stars anymore.

The wormhole interstice opened a million kilometres above the sun's south pole. Its edges immediately expanded. Within three seconds it was over one and a half billion kilometres in diameter, greater than Jupiter's orbit. Fifteen seconds later it reached the size Joshua had designated: twelve billion kilometres across, just wider than the entire solar system. It moved forwards, enveloping star, planets, asteroids, and comets alike.

The interstice contracted to nothing.

All that remained was a single human figure in a black robe, tumbling wildly through space.

In Tracy's lounge, Arnie got up and thumped the top of the television. The picture didn't return.

"What's happening now?" Jay asked.

"Corpus doesn't know," Tracy said. Her hands trembled at the revelation.

Over seventeen million possessing souls in various arcologies were exorcised from their captive bodies as Earth moved

into the wormhole. Joshua arranged its internal quantum structure in a fashion similar to the conditions Dariat and Rubra had used to expel the possessors from Valisk. There was one difference: they didn't become ghosts, this time they were torn cursing in anguish straight back into the beyond. From Earth, orbiting thirty thousand light-years from the centre of the galaxy, the glorious blaze of the core stars had never been visible. There was too much dark mass spread throughout the spiral arms, interstellar gas clouds and dust storms absorbing the light spun off from the densely packed supergiants. Astronomers had to turn their telescopes outwards, studying other starpools to see what such a spectacle might be like.

You had to be a lot closer in towards the centre to see the core's corona starting to expand over the shielding plane of dark matter. Even then, it would only be an exceptionally bright crescent nebula stretched across the night sky. To witness its full glory, a planet needed to be perched right at the root of the spiral arms where the core appeared as an iridescent cloak of silver-white light across half of space, outshining the local sun. Regrettably, such a place was lethal; a fierce outpouring of intense radiation from the tightly clustered stars would immediately sterilise any unprotected biological life.

No, to gain a full appreciation of the galaxy's native beauty, it had to be observed from outside. Above the spiral arms, and away from the radiation.

Joshua chose a location 20,000 light-years out from the core and 10,000 to the north of the ecliptic. The solar system emerged there to be greeted with the sight of a majestic bejewelled cyclone shining fiercely against a blackness devoid of any constellations.

The Kulu system was the next to arrive. Then Oshanko. Followed by Avon. Ombey. New California. They no longer emerged one at a time. The singularity was capable of creating wormholes simultaneously. Joshua shifted his participa-

tion to the executive, selecting what was to be taken. Gateways were opened into the realms where the possessed had fled with their planets. Lalonde, Norfolk, and all the others were returned to their stars, then moved out of the galaxy.

The Confederation soon formed its own unique, isolated stellar cluster sailing serenely through intergalactic space. Eight hundred stars orchestrated into a classic lenticular formation with Sol at the centre, and the rest never more than half a light-year from each other.

Other, more subtle, astronomical modifications were made, seeds of the changes to come.

Quinn didn't understand why he was still alive. During the cataclysm, Edmund Rigby's pitiful soul had been wrenched from the prison he'd forged at the centre of his mind. He no longer had any contact with the beyond, no interdimensional rift to bestow his fabulous energistic power. No magical sixth sense. And he was floating through empty space, with air to breathe.

"My Lord," he cried. "Why? Why did you take the victory from me? Nobody has served you better."

There was no answer.

"Let me go back. Let me prove myself. I can make Night fall. I will ride the dark angels into heaven, we will tear it down and sit You upon the throne."

A human figure appeared in front of him, bathed in gentle starlight. Quinn drew in an excited breath as he drew closer. It was spat out in disgust as he recognized the face. "You!"

"Hi, Quinn," said Joshua. "Ranting won't do you any good. I resealed the opening to the dark continuum, the fallen angels aren't coming to rescue you. Nobody is."

"God's Brother will win. Night will fall with or without me at the head of His army."

"I know."

Quinn gave him a suspicious glare.

“You were right all along, though not in a way you imagined. This universe ends in darkness.”

“You believe that? You accept the gospel of God’s Brother?”

“Your gospel is a load of shit, and you’re the only asshole to squirt it out, Quinn.”

“I will find your soul in the beyond. When I do I will crush your pride and—”

“Oh, shut up. I have an offer for you. In words you’ll understand, I want you to lead the lost souls to your Lord.”

“Why?”

“Many reasons. You deserve to be erased from time for what you did. But I can’t do that.”

Quinn started to laugh. “You’re an angel of the false Lord. That’s why you have the power to snatch me away from Earth. Yet He won’t let you kill me, will He? He is too compassionate. How you must hate that.”

“There are worse things than death and the beyond. I can deliver you to the fallen angels. Do you think they’ll be happy to see someone who failed to free them?”

“What do you want?”

A circular opening in space expanded behind Joshua. “This leads into Night, Quinn. It’s a wormhole that takes you straight to the time of God’s Brother. I’ll allow you to go through it.”

“Name your price.”

“I’ve told you, lead the damned souls out of the beyond and into your Night. Without them, the human race will stand a chance to grow. They are a terrible burden on any species who discovers the true nature of the universe. The Kiint, for instance, cloned mindless bodies to house their lost souls. It took them thousands of years, but every one was brought back, and loved, and taught to face the beyond as it should be faced. But that’s the Kiint, not us. We’re going to have a big enough task helping the living over the

next few decades. There's no way we can deal with all those billions of lost souls, not for centuries. And all that time, they'll be suffering and inhibiting our development."

"My heart bleeds."

"You don't have one." Joshua drifted to one side. There was nothing between Quinn and the opening now. "Now tell me, do you want to meet God's Brother?"

"Yes." Quinn stared greedily into the absolute blackness revealed by the opening. "Yes!"

The souls who had been cast back into the beyond brought with them a devastating tide of bitterness and fury as they raged impotently against the atrocity. Freedom existed, it was possible to regain a life. Now there was only purgatory again. No chink existed in the barrier between them and reality. They screamed their wrath, at the same time pleading with those they could dimly sense moving on the other side. Begging to be let back, for just one last taste of sensation. None of the living heard them any more.

A fissure opened. One small precious gap leaking the most gorgeous human sensations into the cursed void. They flocked around it, rejoicing in its magic. And there was enough for all to feast upon. Every lost soul knew the touch of air upon skin, saw myriad constellations shimmering against the night sky.

Quinn screamed himself raw as he was possessed by a hundred billion lost souls. Their violation was total, devouring the import of every single cell that was him.

His body soared through the opening, carrying the burden of humanity with him. The wormhole closed behind them, cutting off the sight of the stars which humans had always known as their own.

29

Though it would never be told this way, Louise actually spent most of the summoning ceremony unaware of what was happening. After Courtney shoved her down on the bench she rolled onto her side, fighting the dreadful nausea. Little of anything Quinn said registered through the pain and misery. The backlash from the energistic power marshalled by the possessed set off concussions of fright inside her skull.

Then the solid rocket motors ignited, smothering her in choking smoke. She was on the floor retching desperately as the Orgathé drew up level with the gallery.

She lay there shivering between peaks of flame and ice, crying wretchedly. Then all the external sensations began to die away, abandoning her in a stinking grainy grey smog that obscured everything save a few yards of the gallery.

Footsteps crunched on the powdery debris that'd showed down when the escape pod hit the cathedral's dome. They stopped beside her. She moaned, aware that the person was bending down. A hand stroked the side of her head, tenderly brushing the hair from her eyes.

"Hello, Louise. I said I'd come back for you."

It was the wrong voice. An impossibility. But so utterly

right. Louise blinked up, and tears flooded her eyes again. "Joshua!"

His arms went round her, and he kept saying: "Shush, it's all right, it's all right," as he rocked her shaking body against him.

"But Joshua—"

He kissed her gently, tapped his forefinger on her nose. "It's okay, it's all over. I promise."

"Quinn," she gasped. "Quinn, he's . . ."

"Gone. Over. Finished."

Her head swung from side to side, seeing the tendrils of smog slowly withdrawing from the gallery. The cathedral below was shockingly quiet.

"Here," Joshua said. "Let's get you sorted out." He pulled the wrapping off a medical nanonic package, and applied it gently to her face where Quinn had struck her.

She realized her neural nanonics were back on-line, and hurriedly put her medical monitor program into primary.

"It's all right," Joshua said softly. "Our baby's fine."

"Huh," Louise grunted. "How do you know about . . ."

He kissed her hand. "I know everything," he said with that beautifully wicked Joshua grin. The very same one which had started all this. Louise thought she might even be blushing.

"If you could hang on to the questions for a moment," he said. "There's someone you have to say goodbye to."

Louise let him help her up to her feet, glad of the assistance. Every part of her seemed to be aching and stiff. When they were standing, she just couldn't resist giving him another kiss, making sure he was real. And no way was she going to let go of his hand. Then she saw Fletcher standing behind him.

"My lady." Fletcher bowed deeply.

She drew a sharp breath. "The possessed."

"Gone," Joshua said. "Except for Fletcher. And he's not exactly possessing anybody any more; this is a simulacrum

body.” He offered his hand to the solemn naval officer. “I wanted to thank you in person for looking after Louise through all this.”

Fletcher nodded gravely. “I confess I have been curious as to what man might be worthy of Lady Louise. I see now why she speaks of no other.”

Louise knew for sure she was blushing this time.

“Am I now to return to that purgatory, sir?”

“No,” Joshua said. “That’s something else I wanted to tell you. You were there because of your own decency. Leaving your family and your country, mutinying against your king, were all terrible crimes. You convinced yourself of that, and imposed your own punishment. Purgatory was what you believed you deserved.”

Fletcher’s eyes darkened with remembered pain. “In my heart I knew what we were doing was wrong. But Bligh was cruel beyond any man’s endurance. We could withstand no more.”

“It’s over now,” Joshua said. “It’s been over for nearly a thousand years. What you have done for Louise and others this time is enough to pardon a hundred mutinies. Have courage, Fletcher, the beyond is not all there is. Sail through it. Find the shore that lies on the other side. It *is* there.”

“I could never doubt a man of your valour, sir. I will do as you say.”

Joshua stood aside.

“My lady.”

She hugged him tightly. “I don’t want you to go.”

“This is not where I belong, my dearest Louise. I am adrift here.”

“I know.”

“But still, I consider myself privileged that I have known you, however bizarre the circumstances. You will prosper, I foretell, and your child too. Your universe is a many-splendored thing. Live your life in it to the full.”

“I will. I promise.”

He kissed her on the brow, almost a blessing. “And tell the little one I shall think of her always.”

“Bon voyage, Fletcher.”

His body began to attenuate, its boundary dissolving into wisps of platinum stardust. An arm was raised in a farewell salute.

Louise stared at the empty space it left for some time. “Now what?” she asked.

“A few explanations, I think,” Joshua said. “I’d better take you over to Tranquillity for that. You need to clean up and rest. And Genevieve is doing truly awful things to the servitor housechimps.”

Louise began to groan. Her breath stalled as the lush parkland of the habitat quietly materialized around her.

Samual Aleksandrovich had spent the last ten minutes accessing the station’s external sensor suite. Even so, he had to see for himself before he could truly believe. The SD control centre had been alarmed by the number of starships which kept appearing above Avon, but swiftly discovered they were all ships who had been en route to other stars. They’d been snatched from interstellar space, emerging in the designated zones above the planet. Once the First Admiral confirmed they weren’t an attack force, he and Lalwani took a lift capsule to the observation lounge.

The big compartment was crowded with naval personnel. They parted reluctantly to allow both admirals through to the curving transparent wall. Samual looked out in trepidation at space without stars. The station’s rotation slowly brought the galaxy into view; its core shining gold and violet, embraced by the silver shimmer whorl of satellite stars.

“Is it ours?” Samual asked quietly.

“Yes sir,” Captain al-Sahhaf said. “SD command is using the sensor satellites to identify neighbouring galaxies. They

correspond to the known pattern, which puts us approximately ten thousand light-years outside.”

Samual Aleksandrovich turned to Lalwani. “Is this where the possessed come, do you think?”

“I’ve no idea.”

“Ten thousand light-years. What in God’s name did this to us?”

“Joshua Calvert did, sir.”

Samual Aleksandrovich gave Richard Keaton a very suspicious look. “Would you care to qualify that remark, Lieutenant?”

“Calvert and the voidhawk *Oenone* succeeded in their mission, sir. They found the Tyrathca Sleeping God. It’s an artefact capable of generating wormholes on this scale.”

Samual and Lalwani traded a look.

“You seem remarkably well informed,” Lalwani said. “I’m not aware of any communication from *Oenone* or the *Lady Macbeth* reaching us since we arrived here.”

Keaton gave an embarrassed smile. “I apologise that you didn’t know in advance. Nonetheless, Calvert transferred every Confederation world out here.”

“Why?” Samual asked.

“Moving a possessed body through the specific class of wormhole we just came through closes the rift which allows a soul to extrude from the beyond into this universe. He simply did it en masse. The lost souls have all been returned to the beyond. He also brought back all the planets which the possessed had taken away.” Keaton gestured at the empty void outside. “The whole Confederation is here. There is no more possession crisis.”

“It’s over?”

“Yes, sir.”

Samual narrowed his eyes as he contemplated his staff captain for a long moment. “The Kiint,” he said eventually.

“Yes, sir. I’m sorry, I am one of their operatives.”

"I see. And what part did they play in all this?"

"None." Keaton grinned. "This surprised the hell out of them, too."

"I'm glad to hear it." Samual glanced out at the galaxy again as it began to slide from view. "Is Calvert going to take us back?"

"I don't know."

"The Kiint agreed they would help us with medical supplies if we solved this crisis. Will they honour that promise?"

"Yes sir. Ambassador Rulour will be happy to extend the Kiint government's full cooperation with the Confederation."

"Good. Now get your shabby arse out of my headquarters."

The doors parted before Joshua could datavise his arrival.

"Welcome home," Ione said. She dabbed a platonic kiss on his cheek.

He led Louise into the apartment, enjoying her little gasp of astonishment as she saw the glass wall looking out over the bottom of the circumfluous sea.

"You're the Lord of Ruin," Louise said.

"And you're Louise Kavanagh, from Norfolk. Joshua talks about you all the time."

Louise smiled as if she didn't believe. "He does?"

"Oh yes. And what he hasn't told me about you, Genevieve certainly has."

"Is she all right?"

"She's fine. I've got Horst Elwes looking after her. They're on their way. Which should just give you time to freshen up."

Louise glanced down at Andy's dilapidated clothes. "Please."

Joshua poured himself a hefty glass of Norfolk Tears while Ione was showing Louise the bathroom. "Thanks," he said when she came back.

“You did it, didn’t you? That’s why we’re here.”

Yeah. I did it. No more possessed.

A plucked eyebrow was raised delicately. **And when did you pick up this ability?**

A little gift from the Sleeping God. He let the memories flood out directly, showing her and Tranquillity what had happened.

I was right about you, all along. Her arms circled round him, and she stood on her toes to give him a kiss.

Joshua gave the door to the bathroom a guilty glance.

Ione smiled wisely. **Don’t worry. I won’t mess things up.**

“I don’t know what to do about her, Ione. Damnit, I ruled the universe, I was given the answers to everything, and I don’t know what to do.”

“Don’t be stupid, Joshua, of course you know. You’ve always known.”

Brad Lovegrove regained control of his body as if waking from a debilitating coma. Every thought, every action, was dreadfully slow and confused. The whole period of Capone’s possession retained the constituency of a feverish dream, flashes of revolting clarity stitched together by slipstream blurs of sensation and colour.

He found he was sitting at a glass-topped table. It was in the lounge of a five-star hotel suite. A big picture window showed New California sliding past outside. There was a pot of hot coffee in front of him, cups, a plate with a pile of scrambled eggs. A thick pool of blood was spreading over the glass, flowing round the plate to reach the edge. Big scarlet drops splattered onto the carpet around his feet.

A woman in the chair opposite was crumpled over her half of the table. Three quarters of her body was covered in green medical nanonic packages; with a navy-blue towelling robe worn over them. One package from her throat had been re-

moved and placed on the table. The skin it exposed had a savagely deep cut, opening her carotid artery. There was a small fission blade knife nestling in the hand of her outstretched arm.

Brad Lovegrove fell off his chair, burbling incoherently with shock.

Joshua and Louise waited by the airlock hatch of docking bay MB 0-330. They'd both accessed the sensors around the bay, watching *Lady Macbeth* settle lightly on the cradle. Her chemical verniers puffed out fast bursts of bright yellow flame around the equator as Liol brought her in. She touched the cradle in perfect alignment, and the holding latches closed. Utility hoses and cables rose up to jack in one by one. Thermo-dump panels folded down into the hull, and the whole assembly started to sink down into the bay.

He did that well, Joshua admitted to himself. **How are you doing?** he asked Syrinx.

Almost there, she told him.

Affinity showed him the big voidhawk sticking close to the *Mindori* and *Stryla* as the blackhawks curved round the spaceport spindle to chase the habitat's docking ledge. The two blackhawks needed guiding and coaxing: their personalities were almost traumatised into catatonia by the possession. Both of them desperately wanted their lost captains. It wouldn't happen, Joshua knew, Kiera had destroyed the bodies back on Valisk, forcing the newly possessing souls into the blackhawks.

They will recover with time, *Oenone* said softly. **We will be here for them.**

I'm sure you will.

Congratulations, Joshua Calvert, the Jovian Consensus said. **And our profound thanks. Samuel has told us that it was you alone who communed with the singularity.**

I had plenty of help reaching it, he said. A smile image flashed between himself and Syrinx.

Your method of terminating the crisis was spectacular, Consensus said.

Believe me, it was one of the quiet options. Godpower is a modest understatement for the singularity's abilities.

Are you still in contact?

Yes. For the moment. There's a few loose ends I want to tie up myself. After that, it's over.

To abandon such power requires considerable strength of character. We are happy to see Samuel's faith was not misplaced.

To be honest, a life spent jumping round the Confederation righting wrongs really doesn't appeal. From now on all I carry is a message.

Joshua Calvert, missionary, Syrinx teased. Now there's a real miracle.

Will you be returning the Confederation stars to their original position? Consensus asked.

No. I want them to stay here. That also is my decision.

And one we will have to abide by. After all, it will not be easy for us to send a starship back to the Sleeping God from here.

It's not impossible. But then that's the whole point.

Would you explain?

Humans have been lucky in the past, expanding and colonising our way across the galaxy. I'm not knocking it. Things were pretty bad back there on Earth for a while. As a species we needed to get away, as the old saying goes, to put our eggs in more than one basket. But it can't go on forever. We have to face up to the future, and develop in different ways. There are eight hundred stars out here in this cluster, that's all. There can be no more physical expansion at our current social, economic, and technological level. No more run-

ning away from our problems; we're mature enough to address them now.

And our isolation will ensure that we do.

I'm hoping it will concentrate a few minds, yes.

We will live in interesting times.

All times are interesting if you know to live them properly, Joshua said. I have the new coordinates of the other stars for you. You'll have to send out voidhawks to them and spread the information, put us all back in contact.

Of course.

Joshua let the information flow out of his mind and into the Consensus.

The airlock opened, and his crew came flooding out yelling raucous greetings.

Liol hugged him first. "Fine bloody captain you make! You abandon us there to have fun all by yourself, and the next thing we know we've got Jupiter's SD command screaming at us."

"I brought you back, what more do you want?"

Sarha squealed and wrapped herself round him. "You did it!" She kissed his ear. "And what a view."

Dahybi slapped his back, laughing ecstatically. There were Ashly and Beaulieu, pushing at each other to get at him. Monica said: "Looks like you got it right," without sounding too much of a grudge. Samuel chuckled at her obstinacy. Kempster and Renato chided him for cutting off their observations so abruptly. Mzu barely thanked him before asking about the singularity's internal quantum structure.

In the end he held up his arms and shouted at them all to shut the hell up. "Party in Harkey's Bar, right now, and the drinks are on me."

Beth and Jed were pressed up against the big port in the lounge as Tranquillity expanded outside.

"It looks just like Valisk," he said excitedly.

“Let me see!” Navar demanded.

Jed grinned, and they stepped aside. The lounge was weird now. The outlines of the steamship fittings ran through the actual walls and equipment, solid ridges cutting through composite and alloy alike. Hints of the false colours and textures were still there if he squinted hard and remembered what had gone before.

They knew where they were and roughly what had happened, because *Mindori* had spoken to them a couple of times. But the blackhawk wasn't very communicative.

“I think we're landing,” Webster said.

“Sounds good,” Jed said. He got in a good kiss with Beth. Gari gave them one dismissive glance, and went back to watching the docking ledge.

“We'd better check on Gerald,” Beth said.

Jed tried to be a sport. At least the old loon would finally be out of his life after they landed.

Gerald hadn't moved from the bridge since the amazing xenoc diskcity vanished abruptly and Loren's possession had ended. For hour after hour during the stand-off he had stood at the weapons console, like some old-time mariner gripping the wheel during a storm. His vigilance never wavered the whole time. When it ended, he'd slithered down and sat there, legs splayed on the floor, back propped up against the side of the console. He stared straight ahead through hazed eyes, not saying a word.

Beth crouched down beside him and clicked her fingers in front of his face. There was no response.

“Is he dead?” Jed asked.

“Jed! No he's not. He's breathing. I think he must have some kind of exhaustion problem.”

“We'll add it to the list,” Jed muttered, *very* quietly. “Hey Gerald, mate, we've landed. The *Stryla* came down with us. That's the one with Marie in. Good, huh? You'll be seeing her soon, then. How about that?”

Gerald kept staring ahead, unmoving.

“Guess we’d better ask for a doc to see him,” Jed said.

Gerald turned his head. “Marie?” he whispered.

“That’s it, Gerald,” Beth said. She gripped his upper arm tightly. “Marie’s here. Just a few minutes now and you can see her again. Can you get up?” She tried to lift him, stir him into moving. “Jed, shift yourself.”

“I dunno. Maybe we should leave him for the doc.”

“He’s fine. Aren’t you, Gerald, mate. Just knackered, that’s what.”

“Well, okay.” Jed leant over, and tried to tug Gerald up.

Several loud clanking sounds came from the airlock.

Gari ran in. “The bus is here,” she said breathlessly.

“It’ll take us to Marie,” Beth said encouragingly. “Come on, Gerald. You can do it.”

His legs twitched feebly.

Between them, they got him standing. With one on either side, and Gerald’s arms round their shoulders, they shuffled him towards the airlock.

Marie sat hunched up on the corridor floor outside the bridge. She hadn’t stopped crying since Kiera had been exorcised. The memories of what had happened since Lalonde were vivid, deliberately so. Kiera hadn’t cared about Marie knowing what was going on, what her body was doing.

It was disgusting. Filthy.

Even though it wasn’t her performing those acts, Marie knew she would never banish what her body had done. Kiera’s soul might have gone, but her haunting would never be over.

She’d been given her life back, and couldn’t see a single reason for living it.

The airlock cycled, and the hatch whirred open.

“Marie.”

It was a frail, pained croak, but it sliced right into her

soul. "Daddy?" she moaned incredulously. When she looked up he was standing in the airlock, holding on to the rim. He looked dreadful, barely managing to stand. But his frail old face was suffused with all the joy of a father holding his infant child for the first time. She couldn't begin to imagine what he'd gone through to be here at this time. And he'd suffered it all because she was his daughter, and that alone entitled her to his love forever.

She stood and held out both hands to him. Wanting a cuddle from Daddy. Wanting him to take her home where none of this would ever happen.

Gerald smiled wondrously at his pretty little daughter. "I love you, Marie." His body gave way, pitching him face first onto the floor.

Marie screamed and ran forwards. His breath was juddering, eyes closed.

"Daddy! Daddy, no!" She pawed at him in hysterics. "Daddy, talk to me!"

The steward from the bus was shouldering her aside, waving a medical block sensor along Gerald's inert body. "Oh shit. Give me a hand," he yelled at Jed. "We've got to get him into the habitat."

Jed was staring at Marie, unable to move. "It's you," he said, enchanted.

Beth pushed past him and knelt beside the steward. A life support package had covered Gerald's face, pumping air into his lungs.

"Medical emergency," the steward datavised. "Get a crash team to the reception lounge." The medical block datavised a violent alarm as Gerald's heart stopped. He tore the wrapping from a paramedic package and slapped it across Gerald's neck. Nanonic filaments invaded his throat, seeking out the major arteries and veins, pumping in artificial blood, keeping the brain alive.

Rather sheepishly, the participants from the *Disco At The End Of The World* were wandering across the concrete yard in a hungover stupor, watching dawn break over the arcology. It wasn't something any of them had expected to see.

Andy was down there with them, datavising questor after questor into the segments of the net that were coming back on-line. Satellites were providing temporary coverage as the civil authorities began to re-establish some kind of control. Nothing he did could bring an acknowledgement from her neural nanonics. Every programming trick he knew was useless.

He started to walk towards the gate out onto the road. She was out there somewhere; if he had to search the whole arcology himself, he would find her.

"What's that?" someone asked.

People were stopping and looking up at the dome. The sun had only just risen over the eastern rim; it showed a low bank of grey cloud washing in from the north. It reached the geodesic crystal structure and flowed gently round it. Not an armada storm; in fact Andy had never seen a cloud move so slowly before. Then it became curiously hard to see out through the crystal hexagons. The reason took a very long time to register, he even checked the now-fervid news shows to be absolutely certain.

For the first time in nearly five and a half centuries, snow was falling on London.

There was no sign now that humans had ever visited or been involved with the red dwarf star named Tunja. Joshua had moved the settled Dorado asteroids to the New Washington system along with all their industrial stations; the two Edenist habitats were to be found orbiting Jupiter. Nothing remained to tell the new inhabitants of the system's infamous history.

Quantook-LOU had spent two days recovering from the effects of gravity he'd endured in Lalarin-MG. He remained

immobile in his personal space, plugged into Anthi-CL's dataweb, supervising the initial repair work. Conflicts between the diskcity dominions had ended, from surprise rather than agreement to start with. But he had mediated a new peace with the other distributors as they all examined and shared the images which came from sensors mounted on both sides of Tojolt-HI.

The bounty they revealed was almost beyond belief. Mastrit-PJ's entire population of diskcities now orbited the tiny red star, packed together in equatorial orbit. And beyond them was a supply of raw cold matter that defied logic; a vast ring of particles over two hundred million kilometres in diameter. The Mosdva were suddenly drowning in resources.

They could leave the old worn-out diskcities, building new dominions independent from each other. As far as the distributors could tell, every Tyrathca enclave had been emptied at the same time the diskcities were taken from Mastrit-PJ. The conflicts which had cursed the Mosdva since the dominions were established would be over for all time.

Quantook-LOU also had the data from the humans, telling him how to build their faster-than-light ship engines. Other distributors were already mediating for favourable alliances with Anthi-CL, wanting to share the technology. This was a new part of space, strangely empty without the nebula which had dominated half of their old orbit. Billions of stars lay open to them. It would be interesting to find the humans again, and other races of which Joshua Calvert had spoken.

The Ly-cilph's perception field expanded slowly outward as its active functions returned out of their dormancy within its macro-data lattice. At first it believed it had suffered memory loss. It was no longer in the jungle clearing where the human sacrifice was conducted, instead it appeared to be floating in clear space. The perception field could find nothing within range. No mass existed for a billion kilometres,

not even a lone electron, which was extremely improbable. The energy waves washing through the field were of a strange composition, one it had no prior record of. An analysis of this continuum's local quantum structure revealed it was no longer in the universe of its birth.

A dense mass point emerged beside it, emitting a variety of electromagnetic wave functions. It was impervious to the Ly-cilph's probing.

"We understand you are on a voyage to comprehend the full nature of reality," Tinkerbelle said. "So are we. Would you like to join us?"

Oenone's crew appeared in Harkey's Bar amid cheers and boisterous hugs, and the party looked like reaching truly epic proportions. Genevieve loved every minute of it. It was noisy, hot, and colourful; nothing like parties at Cricklade. People were nice to her, she'd managed to drink a couple of glasses of wine without Louise noticing, and cousin Gideon even partnered her on the dance floor. But nothing was funnier than watching the antics of Joshua's brother, who spent the whole time trying to avoid a very beautiful and extremely determined blonde lady.

Louise stuck by Joshua's side the whole time; smiling more from fright than delight as everyone crowded round him, wanting to hear the tale of the naked singularity from his own mouth. Eventually he led her through the door, swearing he'd be back in a second. They took a lift directly up to the lobby and walked out into the parkland.

"You looked unhappy in there," he said.

"I didn't realize you had so many friends. I never really thought about it. I only ever met you and Dahybi before."

He led her down a path lined by orange wimwillows, towards a nearby lake. "I never met half of them before today."

"It's so pretty here," Louise sighed as they reached the shore of the lake. The water-plants had balloon-like flowers

that hung an inch below the surface; green fish nibbled at the tuft of stamen coming from their crowns. "This must have been a wonderful place to grow up in."

"It was. But don't tell Ione, all I ever wanted to do was fly away."

"She's very beautiful."

He held her closer. "Not as beautiful as you."

"Don't," she said, troubled.

"I can kiss my fiancée if I want. Even Norfolk permits that."

"I'm not your fiancée, Joshua. I just kept saying that because of the baby. I was ashamed. Which is so stupid. Having a baby is a wonderful thing, the best thing any two people can do. Fancy being prejudiced against it. I'll always love my home, but so much of it is wrong."

He dropped down on one knee, and held her hand. "Marry me."

From the expression on her face she could have been in agony. "That's very kind, Joshua, and if you'd asked that day you left Cricklade I'd even have eloped with you. But, really, you don't know anything about me. It wouldn't work; you're a starship captain and unutterably famous, I'm a landowner's daughter. All we ever were was a beautiful dream I had once."

"I know everything there is to know about you. Thanks to the singularity, I've lived every second of your life. And don't you ever call yourself someone else's daughter again. You're Louise Kavanagh, nothing else. I had one exciting flight, which was the result of thousands of people backing me up behind the scenes. You walked right up to Quinn Dexter and tried to stop him. It is not possible to possess more courage than that, Louise. You were astonishing. Those drunken buffoons in Harkey's Bar look up at me. I stand in awe at what you did."

"You saw everything I did?" she enquired.

“Yes,” he said firmly. “Including last night.”

“Oh.”

He gently pulled at her hand, making her kneel beside him. “I don’t think I could marry a saint, Louise. And you already know I’ve never been one.”

“Do you really want to marry me?”

“Yes.”

“But we’d never be together.”

“Starship captains are a thing of the past now, just like landowner daughters. There’s so much we have to do in our lives.”

“You don’t mind living on Norfolk?”

“We’ll change it together, Louise. You and me.”

She kissed him, then smiled demurely. “Do we have to go back to the party?” she murmured.

“No.”

Her smile widened, and she stood up. Joshua stayed on one knee.

“I haven’t had my answer yet. And this classic routine is killing my leg muscle.”

“I was taught to always keep a man waiting,” she said imperiously. “But your answer is yes.”

“Anastasia, is that really you?”

“Hello, Dariat, of course it’s me. I waited for you. I knew you’d come eventually.”

“I very nearly didn’t. There was a spot of trouble back there.”

“Lady Chi-ri has always smiled upon you, Dariat. Right from the start.”

“You know, this isn’t what I expected to find on the other side of the beyond.”

“I know. Isn’t it wonderful?”

“Can we see it together?”

“I’d like that.”

It was the last time Joshua would use the ability, and strictly speaking it wasn't necessary, but there was absolutely no way he was going to miss out on seeing the Kiint home system in person just for the sake of virtue and dignified restraint. He materialized on the white-sand beach not far from Tracy's chalet. The coast was exquisite, of course. Then he looked up. Silvery planet crescents curved away through the deep-turquoise sky.

"Now I've seen it all," he said quietly.

Five white spheres erupted in the air around him. The same size as providers, but with a very different function.

Joshua held his arms up. "I am unarmed. Take me to your leader."

The spheres winked out of existence. Joshua laughed.

Jay and Haile were racing over the sands to him.

"Joshua!"

He managed to catch her as she jumped at him. Swung her round full circle.

"Joshua!" she shrieked happily. "What are you doing here?"

"Come to take you home."

"Really?" Her eyes were rounded with optimism. "Back to the Confederation?"

"Yep, go pack your bags."

Greetings, Joshua Calvert. This day is filled with much joyfulness. I am much content.

"Hi, Haile. You've grown."

And you have strengthened.

He put Jay down. "Well what do you know, there's hope for all of us."

"It's been fab here," Jay said. "The providers give you everything you want, and that includes ice cream. You don't need money."

Two adult Kiint appeared on the black teleport circle.

Tracy was coming down the steps from her chalet. Joshua eyed them all cautiously.

“And I’ve been to loads of planets in the arc. And met hundreds and hundreds of people.” Jay paused, sucking on her lower lip. “Is Mummy all right?”

“Uh, yeah. This is the hard part, Jay. She’s going to need a day or two before she can see you. Okay? So I’m going to take you back to Tranquillity, and then you can go back to Lalonde with all the others in a little while.”

She pouted. “And Father Horst?”

“And Father Horst,” he promised.

“Right. And you’re sure Mummy’s fine?”

“She is. She’s really looking forward to seeing you, too.”

Tracy stood behind Jay, and patted her on the head. “I’ve told you to wear a hat when you play out here.”

“Yes, Tracy.” The little girl pulled a face at Joshua.

He grinned back. “You go and pack. I just need to talk to Tracy for a moment. Then we’ll be off.”

“Come on, Haile.” Jay grabbed one of the Kiint’s tractamorphic limbs, and they hurried off towards the chalet.

Joshua’s grin faded when the youngsters were out of hearing. “Thanks for nothing,” he said to Tracy.

“We did what we could,” she said fiercely. “Don’t you judge us, Joshua Calvert.”

“The Corpus judges us, decides our fate.”

“None of us asked to be born. We’re more sinned against than sinners. And Richard Keaton saved your arse, as I recall.”

“So he did.”

“We would have made sure something survived. Humanity would have carried on.”

“But in whose image?”

“You’re proud of your current one, are you?”

“As a matter of fact, yes.”

She rubbed a white hand over her forehead. “I keep run-

ning comparisons. What the human race is compared to so many others.”

“Well don’t, it’s not your concern any more. We can find our own way now.” He turned to the adult Kiint. **Hello Nang, Lieria.**

Greetings, Joshua Calvert. And congratulations.

Thank you. Though this isn’t quite how I thought I’d spend my wedding night. I’d like Corpus to remove your observers and the data acquisition systems from the Confederation, please. Our future contact should be conducted on a more honest basis.

Corpus agrees. They will be removed.

And the medical help. We need that badly, right away. Of course. It will be provided.

You could have helped us before.

Every race has the right, and obligation, to control its own destiny. The two cannot be separated.

I know, reap what you sow. We might be too aggressive, and not progress as fast as we ought, but I want Corpus to know I am immensely proud of our compassion. No matter how fabulous your technology is, what counts is how it’s used.

We acknowledge your criticism. It is one that is levelled at us constantly. Given our position it is inevitable.

He sighed and looked up at the arc again. **We’ll get here eventually.**

Of that we are sure. After all, you have already made a start.

Imitation is the most sincere form of flattery, Joshua said. So I guess that means you’re not all bad after all.

Jay appeared on the chalet veranda carrying a bulging shoulder bag. She shouted and waved, then charged down the steps.

“Is her mother all right?” Tracy asked urgently.

“She’s treatable,” Joshua said. “That’s all I can say. I’ve stopped intervening now. It’s just too damn tempting. Not that the singularity would permit much more.”

“It doesn’t need any more. Corpus analysed what you’ve done. You made some smart moves. The current economic structure won’t survive.”

“I provided the opportunity for change, plus one small active measure. What happens after . . . well, let’s just say, I have faith.”

Jed and Beth stayed with Marie in the hospital waiting room. Beth wasn’t exactly overjoyed about that, she would have loved to see Tranquillity’s park. But Gari, Navar, and Webster were settled in the paediatric wing which wasn’t far away. She didn’t know what was going to happen to any of them next, but then right now that applied to a lot of the human race. There were worse places to be cast ashore.

The doctor who’d met the bus came out of the emergency treatment centre. “Marie?”

“Yes?” She looked up at him, bright with hope.

“I’m terribly sorry, there was nothing we could do.”

Marie’s mouth parted silently, she covered her face with her hands and started sobbing.

“What happened to him?” Beth said.

“There was some kind of nanonic filament web in his brain,” the doctor said. “Its molecular structure had broken down. Disintegration caused a massive amount of damage. In fact, I really don’t understand how he could have survived at all. You said he’s been with you for weeks?”

“Yes.”

“Ah well, we’ll do a postmortem, of course. But I doubt we’ll learn much. I think it’s a symptom of the times.”

“Thanks.”

The doctor smiled briskly. “The counselor will be along

in a moment. Marie will have the best help possible to overcome this. Don't you worry."

"Great." She saw the way Jed was looking at Marie, as though he wanted to be crying with her, or for her, sparing her the burden.

"Jed, we're done here," Beth said.

"What do you mean?" he asked in puzzlement.

"It's over. Are you coming?"

He looked from her to Marie. "But we can't leave her."

"Why, Jed? What is she to us?"

"She was Kiera, she was everything we dreamed of, Beth, a new start, somewhere decent."

"This is Marie Skibbow, and she'll hate Kiera for the rest of her life."

"We can't give up now. The three of us can start Dead-night again, for real this time. There were thousands of people just like us who wanted what she promised. They'll come again."

"Right." Beth turned and marched out of the waiting room, paying no heed to his braying calls behind her. She hurried for the lift, her heart lifting at the prospect of finally seeing the lush parkland with its sparkling circumfluous sea.

I'm young, I'm free, I'm in Tranquillity, and I'm definitely not going back to bloody Koblat.

It was a great beginning.

The Assembly Chamber was deathly silent as the vote was taken. The ambassadors on the floor were first to register.

From his seat at the Polity Council table, Samual Alexandrovich watched the tally rise. There were several abstentions, of course, and the names were no surprise to him: Kulu, Oshanko, New Washington, Mazaliv, several of their close allies. No more than twenty, though, which made the First Admiral smile contentedly. In diplomatic terms that

was as good as a censure motion in itself, a sharp warning to the larger powers.

The ambassadors of the Polity Council entered their vote. Samual Aleksandrovich was last, pressing the button in front of him, and seeing the last digit click over on the big board. Ridiculous anachronism, he thought, though certainly dramatic enough.

The Assembly speaker got to his feet and gave the President a nervous little bow. Olton Haaker stared straight ahead, not meeting anyone's gaze.

"The motion that this house has no confidence in the President is carried by seven hundred and ninety-eight votes, with none against."

Durringham had never recovered from the devastation wrought by Chas Paske. It was the docks and warehouse sector which had born the brunt of the water's impact. Not that they'd stopped the onrush. Debris from their disintegrating frames had formed a black speckle crest on the wave as it surged on into the town's main commercial district. The wooden buildings with their minimal foundations had crumpled instantly. Three dumpers had been knocked over and pushed along.

A kilometre inland, the resistance offered by energistically reinforced walls managed to protect the buildings, though the mud on which they lay was siphoned away, dragging them back towards the Juliffe as the waters retreated. When they'd drained away, Durringham was left with a broad semicircle of destruction eating right into the heart of the town, a swamp with a million filthy splinters sticking upwards. Bodies lay among them, caked in drying mud and slowly decomposing in the dreadful humidity. Despite this, Durringham continued to function as an urban centre all the time Lalonde was hidden away in a realm outside the universe. Like Norfolk's, its essentially low tech nature allowed

its inhabitants to carry on along virtually the same lines as before. Boats continued to sail up and down the Juliffe, crops were sown and harvested, timber cut and sawn.

Now it was back in the universe. The humidity and daily rains returned with a vengeance. And with the thick carpet of weeds chopped away from the metal grid runway, spaceplanes were arriving once again. They were complemented by Kiint craft, small blunt ovoids that flew up and down the Juliffe and its myriad tributaries collecting people from the villages and delivering them to Durringham. Over two thousand of them were performing ambulance duties, racing round at hypersonic velocity, scanning the jungle for any remaining humans.

The Kiint had set up seven fat thirty-storey towers on the edge of the city. They'd been extruded in one go from a provider, coming fully fitted with all the medical equipment necessary to treat dangerously ill humans.

Ruth Hilton had been picked up on the third day after the Return, as people were calling it. When the flyer landed in front of her, its controlling AI asking her to come inside, she seriously contemplated not bothering. The memories of possession acted like damping rods on her psyche. She certainly hadn't eaten anything since the Return.

In the end it was her hope for Jay which made her climb in. For the last few weeks, her possessor had been soaking up aspects of her personality. She'd travelled between villages, asking for news of Jay and any of the other Aberdale children who might have survived that fateful night. Nobody had heard much from that district after the bomb went off somewhere on the savannah.

For two days she'd lain in the hospital while the Kiint examined her and made her eat. The big xenocs had smeared a bluish jelly on the areas of her skin around her cancers, which sank into her flesh as if she'd suddenly become porous. They told her it would flush her tumour cells away,

a less invasive technique than human medical packages. For one and a half days she peed a very strange fluid.

By the end of the second day she was fit enough to walk around the ward. Like a lot of her fellow patients, she sat in front of the big picture window overlooking Durringham, saying very little. Civil engineering crews were arriving hourly, fat bright-yellow jeeps crawling down the muddy streets. Programmable silicon buildings were mushrooming in the ruined semicircle of mud. Power cables had been strung up; once again electric lights began to shine in several districts during the night.

As far as she was concerned it was wasted effort. There were too many memories, too many dead children out in the jungle. This could never be her home again, not any more. She kept asking the Kiint and the hospital AI if anyone had found Jay. Always the same answer.

Then on the sixth day, Horst and Jay walked into the ward, happy and healthy. She clutched Jay to her, not letting her daughter say anything for a long time while she reaffirmed her will to live by the contact.

Horst pulled a couple of chairs over, and the three of them stared down at the city with its industrious invaders.

“This is going to be a very busy place for the next century,” Horst said, his voice a mixture of surprise and admiration. “Do you remember our first night? The old transient dormitory’s gone now, but I think that’s the harbour where it was.” He pointed vaguely. The circular basins of polyp had survived.

“Will they rebuild them?” Jay asked. She thought all the activity was tremendously exciting.

“I doubt it,” Horst said. “The people who’ll be emigrating here from now on will be wanting five-star hotels.”

Ruth raised her gaze to look across the sky. The morning rainclouds had just departed eastwards, heading inland to soak the villages upriver. They’d left a patch of pristine sky above the town and its boundary of gently steaming jungle.

Five brilliant stars shone through the glaring azure atmosphere, the closest one showing a definite crescent. She thought one of them might be Earth itself.

There were forty-seven terracompatible planets sharing its orbit now. All of them stage-one colony worlds, ready to absorb the population from the arcologies.

“Are we going back to Aberdale?” Jay asked.

“No, darling.” Ruth stroked her daughter’s sun-bleached hair. “I’m afraid we lost this world. People from Earth will come here and make it very different to what it was. They don’t have the kind of past to overcome here which we do. It belongs to them now. We need to move on again.”

The bus rolled smoothly across the docking ledge, and linked its airlock with the reception lounge. Athene was waiting for the pair of them, standing proud in a silky blue ceremonial ship-tunic, the star of captaincy absent from her collar.

I came back, Sinon said. I told you I would.

I never doubted you. But I would have understood if you’d gone on with the crystal entity. It was a fabulous opportunity.

Others took that opportunity. It doesn’t cease to exist because I refuse it.

Stubborn to the very end.

One day humans, or what we become, may make a similar journey by themselves. I would like to think I played my part in the culture which will set us upon such a road.

You are different to the Sinon who left.

I have a soul of my own now. I will not return to the multiplicity; I mean to live out my life in this form.

I’m glad you have found yourself again. I need someone around the house who can keep my appalling grandchildren in line.

He laughed, a harsh brazen clacking. **Every day, all I**

wished for was to return. I was afraid you didn't want me to.

I would never think that thought. Not of you, no matter what you'd done.

I have brought someone with me who suffers far more than either of us.

So I see. She moved forward and gave a slight bow. "Welcome to Romulus, General Hiltch."

It was the moment Ralph had dreaded most of all, passing over the threshold. If there was no forgiveness here he would never find any within this universe. He couldn't even bring himself to smile at the stately old woman whose face contained so much genuine concern. "I have no army to command any more, Athene. I resigned my commission."

"Tell me why you have come, Ralph."

"I came out of guilt. I ordered so many Edenists to their death. The Liberation ruined what it was supposed to save. It existed for vanity and pride, not honour. And it was all my idea. I need to say I'm sorry."

"We'd like to hear you, Ralph. Take as long as you want."

"Will you accept me as one of you?"

She gave him a compassionate smile. "You wish to become an Edenist?"

"Yes, though it's a selfish wish. I was told an Edenist can relieve his burden by sharing it with every other Edenist. My guilt has turned to pure grief."

"That's not selfish, Ralph. You're offering to share yourself, to contribute."

"Will it end? Will I be able to live with what I've done?"

"I've brought up a great many Edenist children in my house, Ralph." She put her arm in his, and started walking him towards the exit. "And I've never had a serpent yet."

It took several weeks for all the mundane functions of government to return to normal after the Confederation was trans-

ferred out of the galaxy. People realized that their circumstances would change, in many ways quite profoundly. Religions strove to incorporate or explain away the singularity's gospel of the universe. Joshua didn't mind that: as he told Louise, conviction in one's God nearly always equated to a conviction in self. Time might well see an end to the undue influence religion had on the way people approached life. Then again, knowing the perversity of humans, maybe not.

Starflight was also altering. Travel between stars never more than half a light-year apart was incredibly quick, and cheap.

Every reporter who interviewed Joshua asked why he hadn't taken the Confederation stars back again. Quite infuriatingly, he just smiled and said he liked the view from out here.

Governments weren't so fond of it. There could never be any outward expansion again, unless new propulsion methods were developed. Funds for wormhole research were quietly increased.

There would be no more antimatter to terrorise planetary populations. The stars where the production stations orbited were all left behind in the galaxy (though Joshua had teleported their crews out). Politicians turned their eyes to the defence budget, seeing how funds could be shifted towards more voter-friendly spending sprees.

The Kiint provider technology was regarded with fascination by the general public as it worked its miracles on the Returned worlds. Everybody wanted one of those for Christmas.

Earth's population was almost schizophrenic over the new stage-one planets available. On the one hand, their own climate had been reset to normal, making the arcology domes redundant. But Earth's surface would take a generation to restore. And if it was restored with forests, meadows, jungles, and prairies, there would be a diaspora from the arcologies which would ruin everything. However, if the population

was spread around the new planets (less than a billion each), all of them would have a natural environment, allowing them to keep their present level of consumerist industrialisation and not totally screw up the atmospheres with waste heat. Assuming that many people could be moved economically—say if you used those nifty little Kiint craft, or something came out of all that new superdrive research.

Small, subtle changes were manifesting in all aspects of Confederation life. They would merge and build on each other. And eventually, Joshua hoped, transformation would become irresistible.

But in the meantime, the methods of governance remained the same. Income had to be earned. Taxes still had to be paid. And laws had to be enforced. Backlogs of court cases worked through.

Traslov was one world where changes would be a long time coming. A terracompatible planet in the last stages of an ice age, it was one of five Confederation penal colonies. Joshua had included them, too. Much to the relief of various governments, Avon included. Traslov was where the criminals which the Confederation Navy brought in were sent.

Prison ship flights resumed after three weeks.

André Duchamp was led into the drop capsule by one of the guards, who fastened him in one of the eight acceleration couches. Once the straps were in place, holding André's arms and legs against the thin padding, his restraint collar was taken off.

"Behave yourself," the guard said curtly, and air swam out through the hatch to fetch the next prisoner.

With supreme self control, André sat quiet. His flesh was still slightly tender where the medical nanonics had been removed. And he was sure those bastard *anglo* quack doctors hadn't fully cured his intestinal tract; he kept getting raging indigestion after meals. If you could call what he'd been fed meals. But his indigestion was nothing to the suffering in-

flicted by the awesome injustice brought down upon his poor head. The Navy blamed him for the antimatter attack against Trafalgar. Him! An innocent, persecuted blackmail victim. It was diabolical.

“Hello there.”

André glared at the badly overweight, balding, middle-aged man in the couch next to him.

“Guess we ought to introduce ourselves, seeing as how we’re going to spend the rest of our lives together. I’m Mixi Penrice, and this is my wife, Imelda.”

André’s face cracked in mortification as a timid woman, also fat and middle aged, waved at him hopefully from the couch beside her husband.

“So pleased to meet you,” she said.

“Guard!” André yelled frantically. “*Guard.*”

There was never any contact between the Confederation at large and Traslov, in that every flight was strictly one way: down. The theory was simple enough. Prisoners, voluntarily accompanied by their family, were shot down into the equatorial band of continent not covered by glaciers. Sociologists, hired by participating governments to reassure civil rights organizations, claimed that if enough people were brought together then they’d inevitably form a stable community. After a hundred years, or a million people, whichever came first, the flights would be stopped. The communities would expand in the wake of the retreating glaciers. And in another hundred years a self-sustaining agrarian civilization would emerge with a modest industrial capacity, at which point they’d be allowed to join the Confederation and develop like a normal colony. As yet, no one had found out if an ex-penal colony would want to join a society which had exiled every one of their ancestors.

André’s drop capsule fired down through the atmosphere, hitting seven gees at the top of its deceleration peak. It plummeted through the low cloud layer and deployed its

parachute five hundred metres from the ground. Two metres from the ground, retrorockets fired in a half-second burst, killing the capsule's final velocity as the chute jettisoned.

The capsule crashed into the scorched earth with a bone-numbing impact. André gasped in shock at the pain transmitted along his spine. Even so, he was the first to recover, and flipped his strap catches open. The hatch was a crude affair, like everything else in the capsule. A wonder they ever got down alive. He pulled the release handle.

They'd landed in a broad valley with gently sloping sides and a fast stone-bed stream running along the bottom. The local grass-analogue was an insipid grey green, its monotony broken by a few wizened dwarf bushes. A cold wind blew against the capsule, carrying tiny grains of white ice. André shivered violently; the chill factor took it well below freezing. He had thought to simply collect his share of the survival equipment from the baggage lockers ringing the base of the capsule and hike away from his fellow exiles. That action would have to be reconsidered now.

When he looked along the other end of the valley, he was amazed to see the distinct globular shape of starship life support capsules embedded in the soil. He could see at least forty of them. A definitive count would have shown André that a total of sixteen starships had been involved in the incident which had seen them cast away here.

A lone figure was striding vigorously over the frozen ground towards the drop capsule: a young man in a black fur coat, with a crossbow slung over his shoulder. He stopped just below the hatch and put his hands on his hips to grin up at André.

"And a very good morning to you, sir; Charles Montgomery David Filton-Asquith at your service," he said. "Welcome to Happy Valley."

The bath water was imbued with the scent of tangerines; bubbles covered its surface to a thickness of ten centimetres. Ione sank into the blood-warm water with a contented moan, sliding down the marble until only her head was visible.

Ooh, that feels good.

You should relax more, Tranquillity said. I am capable of supervising most activities.

I know, but everyone wants the personal touch; I'm starting to feel like a nursemaid rather than a dictator. And I still haven't decided what to do about the Laymil project centre.

Most of its staff are on sabbatical from their university. Downsizing will be a simple matter.

Yes. But I feel we should make more use of its resources, turn it to something new. After all, you and I are technically out of a job these days.

A curious viewpoint.

Face it, we've got to find something else to do. I really don't want to stay here. She allowed the images from the shell's external sensitive cells shimmer up into her mind. Jupiter orbit was alive with starship flights, both Adamist and voidhawk. Two large industrial stations specialising in organic synthesis were being manoeuvred over to Aethra, where they could start repairing the damage to the young habitat's shell. Joshua had transferred all forty-odd young habitats from the stage-one systems into orbit above the glorious orange gas-giant.

This star system is going to be the heart of the revolution, Tranquillity said.

All the more reason we should go somewhere else. What's our status right now? Her consciousness drifted through the habitat, perceiving the state of the induction cables, the parkland, the light-tube, the vast ring of energy patterning cells. Fusion generators out on the docking ledge

were still supplying seventy per cent of Tranquillity's power.

How do you feel about making another jump?

Where to? Tranquillity asked.

I think it's time you and I went home.

Home?

Kulu.

Is this some obscure bid to succeed the throne? Your royal cousins will have a collective heart attack.

But they can hardly refuse me, not after our contribution to the Liberation. Technically, we are a dukedom of the Kulu Kingdom. And there's a lot of He₃ mining activity around Tarron, I'm sure the cloudscoop crews would prefer to be billeted here. And we are an extremely valuable economic asset to any star system.

Why?

Carrying the revolution forwards. We are bitek, they are one of the most anti-bitek cultures in the Confederation. Yet they employed bitek at the first sign of trouble. That's a chink, one we can prize open with our presence. This ridiculous technological segregation has to stop. It helps no one. This is the chance for that new beginning I spoke of. Another little change to add to the momentum for overall cultural reform.

It will not be easy.

I know that. But you have to admit, it's been awfully quiet around here since Joshua left.

I still find that hardest to believe. Handing over the *Lady Macbeth* to his brother and giving up flying. Will he be happy living on Norfolk? It's very peaceful there.

Ione laughed, and reached for a cut-crystal glass of Norfolk Tears. She eyed the fabulous drink as if it was the last drop left in the universe. **I think it's about to become a whole lot noisier.**

Syrinx and Ruben stood patiently in the hospital waiting room as the psychology team assembled. Some of them she knew from her own therapy sessions, and exchanged warm greetings.

This is exciting, *Oenone* said. The last act we will perform in this saga.

You just want to go fly, she teased.

Of course. With the Confederation stars so close, there will be many more flights now.

I wonder what sort of flights, though. Now we've glimpsed Kiint technology, I doubt He₃ fusion will last much longer. Perhaps we'll go into the pleasure cruise business.

I will still love you.

She laughed. **And I you, my love.** Her hand closed a little tighter around Ruben's. **I think I might start having children now. We've faced the worst danger there is, flown to the other side of the nebula, and now life is changing. I want to be a part of it, to embrace what's happening in the most human way possible.**

I like you being truly happy. You are complete.

Only when we're together.

The chief psychologist beckoned. **We're ready for you.**

Syrinx walked over to the zero-tau pod in the middle of the room, standing by its head. The black field vanished, and the lid swung open. She smiled down. "Hello, Erick."

It took only a day for the Kiint to cure Grant of his tumours. He submitted to the treatment of blue jelly with passive grace, meekly doing all that was requested of him. The massive xenocs were so *overwhelming*. Any sort of protest seemed appallingly churlish. They were only here to help, coming to Norfolk's aid out of the kindness of their mighty hearts.

An enormous hospital had been built just outside Colsterworth. In less than an hour, according to those who saw it

extruded. Little flying craft zipped across the wolds, stopping next to anyone they found and asking politely if they needed assistance, then conveying them back to the hospital for the ubiquitous treatment. Apparently Colsterworth's hospital was the one dealing with all the cases on this half of Kesteven island. Another had been built at Boston to handle the city's casualties.

Grant returned to Cricklade once his tumours had been flushed away, wandering round the big manor in a daze. The staff trickled back as they were discharged by the Kiint, looking to him to tell them what to do. That part of his reclaimed existence was easy; he knew exactly what they were supposed to be doing.

It was the reason for them doing it which had left him. He'd got his body back, not his life.

Marjorie returned on the second day, and they clung to each other in miserable desperation. There was still no sign of the girls.

Flying craft started to deliver the men from the militia who had remained in Boston after their possession, dropping down out of the sky at individual cottages and farm houses. The weeping and fragile laughter which came from each reunion was everywhere Grant went.

He and Marjorie drove back to Colsterworth to ask if the Kiint had found the girls. The computer at the hospital said no, but that they were still cataloguing Norfolk's surviving residents. Tens of thousands were being added every hour, it told him, and he would be notified immediately (the Kiint had already repaired the entire planet's telephone network). When he asked for a flying craft to take him to Norwich the computer apologised, saying they couldn't accommodate private flights, all the craft were needed for patients.

They went back to the farm rover, debating what to do next. A Kiint was walking sedately down the broad cobbled street outside, crazily incongruous amid the stone-walled

cottages with their slate roofs and climbing roses. A gang of laughing children were running round it, totally unafraid. It kept holding thin tentacles of tractamorphic flesh just above their heads, flicking them away when the children jumped to catch one. Playing with them.

"It's over, isn't it?" Grant said. "We can't go back to how it was, not now."

"That's not like you," Marjorie said. "The man I married would never allow our way of life to be cast aside."

"The man you married hadn't been possessed. Damn that Luca to hell."

"They'll always be with us, just as we were always with them."

Provider globes were drifting round the manor, ejecting replacements for items which had never been repaired or replaced. The staff followed them, fitting lengths of guttering, hammering new trellis sections onto the walls, mending fence posts, plumbing in sections of central heating pipe. Grant felt like shouting at the globes to go away, but Cricklade needed fixing up: for all Luca's attention its overall maintenance had been pretty shabby during the possession. And providers were doing the same thing for every household in Stoke County. People were entitled to some charity and good fortune after what they'd been through.

He examined that thought, wondering who it had come from. Was it too kind for Grant, not liberal enough for Luca? In the end it didn't matter, because it was right.

When he walked into the courtyard, another provider was repairing the burnt-out stable all by itself. Its purple surface flowed through buckled soot-clad walls and blackened timbers, leaving a broad line of clean straight stone and tiled roof in its wake. The process was like a brush painting detail over a preliminary sketch.

"Now that's what I call a corrupting influence," Carmitha said. "No one's going to forget just how green the grass is on

the other side of the technological divide. Did you know they can make food as well?"

"No," Grant said.

"I've been working my way down an impressive little menu. Very tasty. You should try it."

"Why are you still here?"

"Are you asking me to leave?"

"No. Of course not."

"They'll come back, Grant. You might have loosened up, but you still don't give your own daughters the credit they deserve."

He shook his head and walked away.

Lady Macbeth's brand new ion field flyer landed on the greensward in front of the manor the next day. Its bubble of golden haze evaporated and the hatch opened. Genevieve ran down the airstairs as they slid out, jumping the last couple of feet to the ground.

Grant and Marjorie were already coming down the portico's broad stone steps to find out what the flyer was doing. They both froze when they saw the familiar little figure emerge. Then Genevieve streaked over and cannoned into her mother so hard she nearly knocked both of them over.

Marjorie wouldn't let go of her daughter. She had trouble speaking, her throat was so choked up with crying. "Did . . . did it happen to you?" she asked in trepidation.

"Oh no," Genevieve said breezily. "Louise got us off the planet. I've been to Mars, and Earth, and Tranquillity. I was scared a lot, but it was really exciting."

Louise put her arms around both her parents and kissed them.

"You're all right," Grant said.

"Yes, Daddy, I'm just fine."

He stepped back to look at her, so wonderfully self-confident and poised in her smart-cut travel suit with a skirt that finished well above her knees. This little Louise would

never meekly do as she was told, no matter how much he shouted.

Bloody good thing too, as Luca might have said.

Louise gave both her parents an impish grin and took a deep breath. Genevieve started giggling wildly.

"I'm sure you both remember my husband," Louise said in a rush.

Grant stared at Joshua with complete disbelief.

"I was bridesmaid!" Genevieve shouted.

Joshua put his hand out.

"Daddy," Louise scolded firmly.

Grant did as he was told, and shook Joshua's hand.

"You're married?" Marjorie said faintly.

"Yes." Joshua gave her a level stare, and planted a small kiss on her cheek. "Two days ago."

Louise held up her hand, showing off the ring.

"Oh look," Genevieve said. "Our stuff. I've got so much to show you." Beaulieu, Liol, and Dahybi were struggling down the flyer's airstairs, laden with cases and department-store boxes. Genevieve gallivanted back to help them, her duster bracelet spilling a shiny cometary tail through the air behind her.

"Bloody hell," Grant murmured. He smiled, knowing resistance was useless and being rather glad of it, too. "Ah well, congratulations, my boy. Make damn sure you look after my daughter properly, she means everything to us."

"Thank you, sir." Joshua grinned his grin. "I'll do my best."

Space was different now. A hint at what was to befall in a few billion years.

Galactic superclusters no longer expanded away from each other; they were returning, drifting back to their place of origin. The quantum structure of space-time altered as the

dimensional realms began to press in, flowing back towards the centre of the universe.

The wormhole terminus opened, and Quinn Dexter emerged to look out upon the multitude of forces gathering at the end of time. His body dissolved painlessly, freeing his possessors. They fled away from him, free to move as they chose amid the dense energy strands flooding the cosmos. Life pervaded space all around them, the aether ringing with the song of mind. Liberated, they joined the throng, sailing in towards the omega point.

Quinn watched galaxies being torn apart a million light-years ahead of him, their arms streaming out behind the core as they accelerated into the irresistible black mass. Star clusters flared white, then purple, as they sank below the event horizon, vanishing forever into this universe's final Night.

His serpent beast howled for joy as he saw his Lord's expansion into the dying universe, absorbing every atom, every thought. Triumphant at the very end, the Light Bringer was growing at the heart of darkness, ensuring all which was to follow would be different to everything that had gone before.

EPILOGUE

*Jay Hilton
Gatekeeper's Cottage
Cricklade Estate
Stoke County
Kesteven Island
Norfolk*

My Dearest Haile,

Mother is making me write this with a pen which is a real bore. She says I have to practice my formal writing skills. As soon as I get neural nanonics I'm never going to touch a pen again.

I hope you're well. Don't forget to thank Richard Keaton for bringing you this letter.

The cottage we're renting is really pretty, far better than anything I ever saw on Lalonde. It's got thick stone walls and a thatch roof, and there's a real fireplace that burns logs. The snow is up to the ground floor windows. It's great stuff, you'd

love it. Snowmen are much more fun than sandcastles. I can't get out much, but that's okay. There's lots of interactives to play with, and Genevieve is teaching me how to ski. We're good friends now.

We all stayed up last night to see New California appear. It was due a couple of hours after Duke set, and happened really quickly. It's very bright in the sky, and you can just see it during Duchess-night if you know where to look. That makes five stars visible now. Can you believe that in another fifteen years I'll be able to see all the stars of the Confederation cluster? Isn't that just fab?

Mother is working at the school in Colsterworth, introducing didactic memories. Kesteven council voted to allow them. Joshua Calvert proposed it. He was elected to the council two months ago, and is already the deputy chairman. People here are really proud that he has chosen to come and live at Cricklade when he could have gone anywhere in the Confederation. He has lots of plans for things he wants to see happen, which the council are drawing up. Everyone's really excited about them. Marjorie Kavanagh says it won't last, and he'll be lynched before spring.

Louise had their baby last month. It was a boy, and they're calling him Fletcher. Father Horst is rushing round to get the family chapel ready for the Christening.

I hope you'll visit soon (hint!). Genevieve says the butterflies here are quite wonderful in the summer.

Love and hugs,

Jay

TIMELINE

- 2020** . . . Cavius base established. Mining of Lunar sub-crustal resources starts.
- 2037** . . . Beginning of large-scale geneering on humans; improvement to immunology system, eradication of appendix, organ efficiency increased.
- 2041** . . . First deuterium-fuelled fusion stations built; inefficient and expensive.
- 2044** . . . Christian reunification.
- 2047** . . . First asteroid capture mission. Beginning of Earth's O'Neill Halo.
- 2049** . . . Quasi-sentient bitek animals employed as servitors.
- 2055** . . . Jupiter mission.
- 2055** . . . Lunar cities granted independence from founding companies.
- 2057** . . . Ceres asteroid settlement founded.
- 2058** . . . Affinity symbiont neurons developed by Wing-Tsit Chong, providing control over animals and bitek constructs.
- 2064** . . . Multinational industrial consortium (Jovian Sky Power Corporation) begins mining Jupiter's atmosphere for He₃ using aerostat factories.

- 2064** . . . Islamic secular unification.
- 2067** . . . Fusian stations begin to use He₃ as fuel.
- 2069** . . . Affinity bond gene spliced into human DNA.
- 2075** . . . JSKP germinates Eden, a bitek habitat in orbit around Jupiter, with UN Protectorate status.
- 2077** . . . New Kong asteroid begins FTL stardrive research project.
- 2085** . . . Eden opened for habitation.
- 2086** . . . Habitat Pallas germinated in Jupiter orbit.
- 2090** . . . Wing-Tsit Chong dies, and transfers memories to Eden's neural strata. Start of Edenist culture. Eden and Pallas declare independence from UN. Launch buyout of JSKP shares. Pope Eleanor excommunicates all Christians with affinity gene. Exodus of affinity capable humans to Eden. Effective end of bitek industry on Earth.
- 2091** . . . Lunar referendum to terraform Mars.
- 2094** . . . Edenists begin exowomb breeding programme coupled with extensive geneering improvement to embryos, tripling their population over a decade.
- 2103** . . . Earth's national governments consolidate into Govcentral.
- 2103** . . . Thoth base established on Mars.
- 2107** . . . Govcentral jurisdiction extended to cover O'Neill Halo.
- 2115** . . . First instantaneous translation by New Kong spaceship, Earth to Mars.
- 2118** . . . Mission to Proxima Centauri.
- 2123** . . . Terracompatible planet found at Ross 154.
- 2125** . . . Ross 154 planet named Felicity, first multiethnic colonists arrive.
- 2125–2130** . . . Four new terracompatible planets discovered. Multiethnic colonies founded.
- 2131** . . . Edenists germinate Perseus in orbit around Ross 154 gas giant, begin He₃ mining.
- 2131–2205** . . . One hundred and thirty terracompatible planets discovered. Massive starship building pro-

gramme initiated in O'Neill Halo. Govcentral begins large-scale enforced outshippment of surplus population, rising to 2 million a week in 2160: Great Dispersal. Civil conflict on some early multiethnic colonies. Individual Govcentral states sponsor ethnic-streaming colonies. Edenists expand their He₃ mining enterprise to every inhabited star system with a gas giant.

2139 . . . Asteroid Braun impacts on Mars.

2180 . . . First orbital tower built on Earth.

2205 . . . Antimatter production station built in orbit around sun by Govcentral in an attempt to break the Edenist energy monopoly.

2208 . . . First antimatter-drive starships operational.

2210 . . . Richard Saldana transports all of New Kong's industrial facilities from the O'Neill Halo to an asteroid orbiting Kulu. He claims independence for the Kulu star system, founds Christian-only colony, and begins to mine He₃ from the system's gas giant.

2218 . . . First voidhawk gestated, a bitek starship designed by Edenists.

2225 . . . Establishment of a hundred voidhawk families. Habitats Romulus and Remus germinated in Saturn orbit to serve as voidhawk bases.

2232 . . . Conflict at Jupiter's trailing Trojan asteroid cluster between belt alliance ships and an O'Neill Halo company hydrocarbon refinery. Antimatter used as a weapon; twenty-seven thousand people killed.

2238 . . . Treaty of Deimos; outlaws production and use of antimatter in the Sol system; signed by Govcentral, Lunar nation, asteroid alliance, and Edenists. Antimatter stations abandoned and dismantled.

2240 . . . Coronation of Gerrald Saldana as King of Kulu. Foundation of Saldana dynasty.

2267–2270 . . . Eight separate skirmishes involving use of antimatter among colony worlds. Thirteen million killed.

- 2271** . . . Avon summit between all planetary leaders. Treaty of Avon, banning the manufacture and use of antimatter throughout inhabited space. Formation of Human Confederation to police agreement. Construction of Confederation Navy begins.
- 2300** . . . Confederation expanded to include Edenists.
- 2301** . . . First Contact. Jiciro race discovered, a pre-technology civilization. System quarantined by Confederation to avoid cultural contamination.
- 2310** . . . First ice asteroid impact on Mars.
- 2330** . . . First blackhawks gestated at Valisk, independent habitat.
- 2350** . . . War between Novska and Hilversum. Novska bombed with antimatter. Confederation Navy prevents retaliatory strike against Hilversum.
- 2356** . . . Kiint homeworld discovered.
- 2357** . . . Kiint join Confederation as “observers.”
- 2360** . . . A voidhawk scout discovers Atlantis.
- 2371** . . . Edenists colonize Atlantis.
- 2395** . . . Tyrathca colony world discovered.
- 2402** . . . Tyrathca join Confederation.
- 2420** . . . Kulu scoutship discovers Ruin Ring.
- 2428** . . . Bitek habitat Tranquillity germinated by Crown Prince Michael Saldana, orbiting above Ruin Ring.
- 2432** . . . Prince Michael’s son, Maurice, geneered with affinity. Kulu abdication crisis. Coronation of Lukas Saldana. Prince Michael exiled.
- 2550** . . . Mars declared habitable by Terraforming office.
- 2580** . . . Dorado asteroids discovered around Tunja, claimed by both Garissa and Omuta.
- 2581** . . . Omuta mercenary fleet drops twelve antimatter planet-busters on Garissa, planet rendered uninhabitable. Confederation imposes thirty-year sanction against Omuta, prohibiting any interstellar trade or transport. Blockade enforced by Confederation Navy.
- 2582** . . . Colony established on Lalonde.
